

# Lecture 11: Requirements Modelling

## → A little refresher:

- ↳ What are we modelling?
- ↳ Requirements; Systems; Systems Thinking

## → Role of Modelling in RE

- ↳ Why modelling is important
- ↳ Limitations of modelling

## → Brief overview of modelling languages

## → Modelling principles

- ↳ Abstraction
- ↳ Decomposition
- ↳ Projection
- ↳ Modularity

# Refresher: Definitions

## → Some distinctions:

- ↳ **Domain Properties** - things in the application domain that are true whether or not we ever build the proposed system
- ↳ **Requirements** - things in the application domain that we wish to be made true by delivering the proposed system
- ↳ **A specification** - a description of the behaviours the program must have in order to meet the requirements

## → Two correctness (verification) criteria:

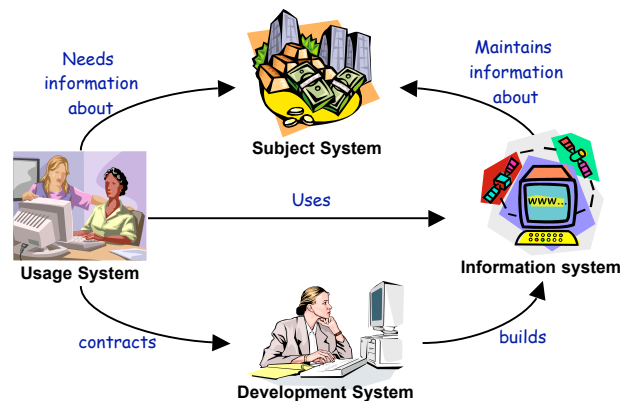

- ↳ The Program running on a particular Computer satisfies the Specification
- ↳ The Specification, in the context of the given domain properties, satisfies the requirements

## → Two completeness (validation) criteria:

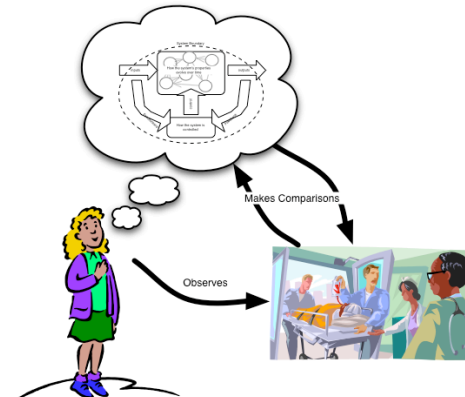

- ↳ We discovered all the important requirements
- ↳ We discovered all the relevant domain properties

# Refresher: Systems to model

# Refresher: Systems Thinking

University of Toronto Department of Computer Science

## Modelling...

- Modelling can guide elicitation:
  - ↳ It can help you figure out what questions to ask
  - ↳ It can help to surface hidden requirements
    - i.e. does it help you ask the right questions?
- Modelling can provide a measure of progress:
  - ↳ Completeness of the models → completeness of the elicitation (?)
    - i.e. if we've filled in all the pieces of the models, are we done?
- Modelling can help to uncover problems
  - ↳ Inconsistency in the models can reveal interesting things...
    - e.g. conflicting or infeasible requirements
    - e.g. confusion over terminology, scope, etc
    - e.g. disagreements between stakeholders
- Modelling can help us check our understanding
  - ↳ Reason over the model to understand its consequences
    - Does it have the properties we expect?
  - ↳ Animate the model to help us visualize/validate the requirements

## RE involves a lot of modelling

- A model is more than just a description
  - ↳ it has its own phenomena, and its own relationships among those phenomena.
    - The model is only useful if the model's phenomena correspond in a systematic way to the phenomena of the domain being modelled.
- ↳ Example:

© Easterbrook 2004 Source: Adapted from Jackson, 1995, p120-122 7

University of Toronto Department of Computer Science

## "It's only a model"

- There will always be:
  - ↳ phenomena in the model that are not present in the application domain
  - ↳ phenomena in the application domain that are not in the model
- 
- A model is never perfect
  - ↳ "If the map and the terrain disagree, believe the terrain"
  - ↳ Perfecting the model is not always a good use of your time...

University of Toronto Department of Computer Science

## Choice of modelling notation

- natural language
  - ↳ extremely expressive and flexible
    - useful for elicitation, and to annotate models for readability
  - ↳ poor at capturing key relationships
- semi-formal notation
  - ↳ captures structure and some semantics
  - ↳ can perform (some) reasoning, consistency checking, animation, etc.
    - E.g. diagrams, tables, structured English, etc.
  - ↳ mostly visual - for rapid communication with a variety of stakeholders
- formal notation
  - ↳ precise semantics, extensive reasoning possible
    - Underlying mathematical model (e.g. set theory, FSMs, etc)
  - ↳ very detailed models (may be more detailed than we need)
    - RE formalisms are for conceptual modelling, hence differ from most computer science formalisms

← UML fits in here

University of Toronto Department of Computer Science

## Desiderata for Modelling Notations

- **Implementation Independence**
  - ↳ does not model data representation, internal organization, etc.
- **Abstraction**
  - ↳ extracts essential aspects
    - e.g. things not subject to frequent change
- **Formality**
  - ↳ unambiguous syntax
  - ↳ rich semantic theory
- **Constructability**
  - ↳ can construct pieces of the model to handle complexity and size
  - ↳ construction should facilitate communication
- **Ease of analysis**
  - ↳ ability to analyze for ambiguity, incompleteness, inconsistency
- **Traceability**
  - ↳ ability to cross-reference elements
  - ↳ ability to link to design, implementation, etc.
- **Executability**
  - ↳ can animate the model, to compare it to reality
- **Minimality**
  - ↳ No redundancy of concepts in the modelling scheme
    - i.e. no extraneous choices of how to represent something

## Survey of Modelling Techniques

- **Modelling Enterprises**
  - ↳ Goals & objectives
  - ↳ Organizational structure
  - ↳ Tasks & dependencies
  - ↳ Agents, roles, intentionality
- **Modelling Information & Behaviour**
  - ↳ Information Structure
  - ↳ Behavioral views
    - Scenarios and Use Cases
    - State machine models
    - Information flow
  - ↳ Timing/Sequencing requirements
- **Modelling System Qualities (NFRs)**
  - ↳ All the 'ilities':
    - Usability, reliability, evolvability, safety, security, performance, interoperability, ...

**Organization modelling:**  
i\*, SSM, ISAC

**Goal modelling:**  
KAOS, CREWS

**Information modelling:**  
E-R, Class Diagrams

**Structured Analysis:**  
SADT, SSADM, JSD

**Object Oriented Analysis:**  
OOA, OOSE, OMT, UML

**Formal Methods:**  
SCR, RSML, Z, Larch, VDM

**Quality tradeoffs:**  
QFD, win-win, AHP,

**Specific NFRs:**  
Timed Petri nets (performance)  
Task models (usability)  
Probabilistic MTTF (reliability)

University of Toronto Department of Computer Science

## the Unified Modelling Language (UML)

- **Third generation OO method**
  - ↳ Booch, Rumbaugh & Jacobson are principal authors
    - Still evolving
    - Attempt to standardize the proliferation of OO variants
  - ↳ Is purely a notation
    - No modelling method associated with it!
    - Was intended as a design notation (some features unsuitable for RE)
  - ↳ Has become an industry standard
    - But is primarily owned by Rational Corp. (who sell lots of UML tools and services)
- **Has a standardized meta-model**
  - ↳ Use case diagrams
  - ↳ Class diagrams
  - ↳ Message sequence charts
  - ↳ Activity diagrams
  - ↳ State Diagrams
  - ↳ Module Diagrams
  - ↳ Platform diagrams

© Easterbrook 2004 12

University of Toronto Department of Computer Science

## Meta-Modelling

- **Can compare modelling schema using meta-models:**
  - ↳ What phenomena does each scheme capture?
  - ↳ What guidance is there for how to elaborate the models?
  - ↳ What analysis can be performed on the models?
- **Example meta-model:**

© Easterbrook 2004 13

University of Toronto Department of Computer Science

## Modelling principles

- **Facilitate Modification and Reuse**
  - ↳ Experienced analysts reuse their past experience
    - > they reuse components (of the models they have built in the past)
    - > they reuse structure (of the models they have built in the past)
  - ↳ Smart analysts plan for the future
    - > they create components in their models that might be reusable
    - > they structure their models to make them easy to modify
- **Helpful ideas:**
  - ↳ **Abstraction**
    - > strip away detail to concentrate on the important things
  - ↳ **Decomposition (Partitioning)**
    - > Partition a problem into independent pieces, to study separately
  - ↳ **Viewpoints (Projection)**
    - > Separate different concerns (views) and describe them separately
  - ↳ **Modularization**
    - > Choose structures that are stable over time, to localize change
  - ↳ **Patterns**
    - > Structure of a model that is known to occur in many different applications

© Easterbrook 2004 14

University of Toronto Department of Computer Science

## Modelling Principle 1: Partitioning

- **Partitioning**
  - ↳ captures aggregation/part-of relationship
- **Example:**
  - ↳ goal is to develop a spacecraft
  - ↳ partition the problem into parts:
    - > guidance and navigation;
    - > data handling;
    - > command and control;
    - > environmental control;
    - > instrumentation;
    - > etc
  - ↳ **Note: this is not a design, it is a problem decomposition**
    - > actual design might have any number of components, with no relation to these sub-problems
  - ↳ However, the choice of problem decomposition will probably be reflected in the design

© Easterbrook 2004 15

University of Toronto Department of Computer Science

## Modelling Principle 2: Abstraction

- **Abstraction**
  - ↳ A way of finding similarities between concepts by ignoring some details
  - ↳ Focuses on the general/specific relationship between phenomena
    - > Classification groups entities with a similar role as members of a single class
    - > Generalization expresses similarities between different classes in an 'is\_a' association
- **Example:**
  - ↳ requirement is to handle faults on the spacecraft
  - ↳ might group different faults into fault classes

<p><b>based on location:</b></p> <ul style="list-style-type: none"> <li>↳ instrumentation fault,</li> <li>↳ communication fault,</li> <li>↳ processor fault,</li> <li>↳ etc</li> </ul>	OR	<p><b>based on symptoms:</b></p> <ul style="list-style-type: none"> <li>↳ no response from device;</li> <li>↳ incorrect response;</li> <li>↳ self-test failure;</li> <li>↳ etc...</li> </ul>
--	----	--

University of Toronto Department of Computer Science

## Modelling Principle 3: Projection

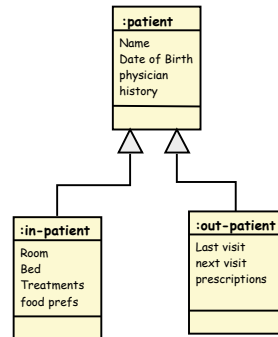

- **Projection:**
  - ↳ separates aspects of the model into multiple viewpoints
    - > similar to projections used by architects for buildings
- **Example:**
  - ↳ Need to model the requirements for a spacecraft
  - ↳ Model separately:
    - > safety
    - > commandability
    - > fault tolerance
    - > timing and sequencing
    - > Etc...
- **Note:**
  - ↳ Projection and Partitioning are similar:
    - > Partitioning defines a 'part of' relationship
    - > Projection defines a 'view of' relationship
  - ↳ Partitioning assumes the parts are relatively independent

### A brief UML example

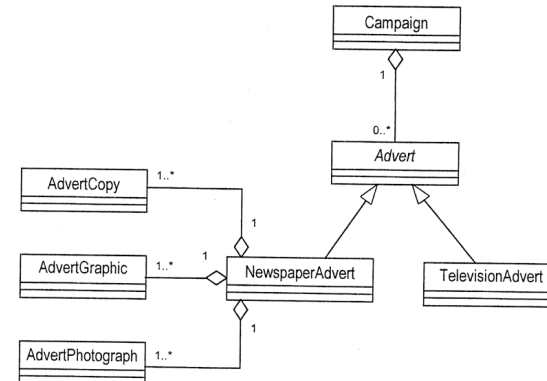

**Generalization**  
(an abstraction hierarchy)

**Aggregation**  
(a partitioning hierarchy)

### What is this a model of?

### Summary

- **Modelling plays a central role in RE**
  - ↳ Allows us to study a problem systematically
  - ↳ Allows us to test our understanding
- **Many choices for modelling notation**
  - ↳ In this course, we'll use (and adapt) various UML notations
- **All models are inaccurate** (to some extent)
  - ↳ Use successive approximation
  - ↳ ...but know when to stop perfecting the model
  - ↳ Every model is created for a purpose
  - ↳ The purpose is not usually expressed in the model
  - ↳ ...So every model needs an explanation
