Propositions and Connectives

Propositional Language

Revisiting the learning goals

# Learning goals

By the end of the lecture, you should be able to

- ▶ Determine whether an English sentence is a proposition.
- ▶ Determine whether an English sentence is a simple or compound proposition.
- ▶ Determine whether a propositional formula is atomic and/or well-formed.
- ▶ Draw the parse tree of a well-formed propositional formula.
- ▶ Given a propositional formula with no parentheses, make it a well-formed formula by adding parentheses according to the precedence rules.

# Outline

Learning goals

**Propositions and Connectives**

Propositional Language

Revisiting the learning goals

# Propositions

A **proposition** is a statement that is either **true** or **false**.

Meaningless statements, commands, and questions are not propositions.

# CQ on proposition

## Examples of propositions

- ▶ The sum of 3 and 5 is 8.
- ▶ The sum of 3 and 5 is 35.
- ▶ Goldbach's conjecture: Every even number greater than 2 is the sum of two prime numbers.

## Examples of non-propositions

- ▶ Question: Where shall we go to eat?
- ▶ Command: Please pass the salt.
- ▶ Sentence fragment: The dogs in the park
- ▶ Non-sensical: Green ideas sleep furiously.
- ▶ Paradox: This sentence is false.

# Compound and simple propositions

- ▶ A **compound** proposition is formed by means of logical connectives.

The commonly used logical connectives are “not”, “and”, “or”, “if, then”, and “iff”.

- ▶ A **simple** proposition is not compound and cannot be further divided.

# Interpreting a compound proposition

To interpret a compound proposition, we need to understand the meanings of the connectives.

Let  $A$  and  $B$  be arbitrary propositions.

We will use  $1$  and  $0$  to denote **true** and **false** respectively.

# Negation

“Not A” is true if and only if A is false.

$A$	not $A$
1	0
0	1

# Conjunction

“A and B” is true if and only if both A and B are true.

$A$	$B$	$A$ and $B$
1	1	1
1	0	0
0	1	0
0	0	0

# Disjunction

$A$	$B$	$A$ or $B$
1	1	1
1	0	1
0	1	1
0	0	0

“Or” may be interpreted in two ways

- ▶ The inclusive sense of “A or B or both”
- ▶ The exclusive sense of “A or B but not both”

In mathematics, the inclusive sense of “or” is commonly used.

# Implication

$A$	$B$	if $A$ then $B$
1	1	1
1	0	0
0	1	1
0	0	1

The only circumstance in which “if  $A$  then  $B$ ” is false is when  $A$  is true and  $B$  is false.

Whenever  $A$  is false, “if  $A$  then  $B$ ” is vacuously true.

# Equivalence

"A iff B" is the same as "if A then B, and if B then A".

iff is pronounced as if and only if.

$A$	$B$	$A \text{ iff } B$
1	1	1
1	0	0
0	1	0
0	0	1

## CQ on compound or simple propositions

## Remarks on connectives

The arity of a connective:

- ▶ The negation is a unary connective. It only applies to one proposition.
- ▶ All other connectives are binary connectives. They apply to two propositions.

Is a connective symmetric?

- ▶ And, Or, and Equivalence are symmetric. The order of the two propositions does not affect the truth value of the compound proposition.
- ▶ Implication is not symmetric. If A then B, and if B then A have different truth values.

Propositions and Connectives

**Propositional Language**

Revisiting the learning goals

# Propositional language $L^p$

The propositional language  $L^p$  consists of three classes of symbols:

- ▶ Proposition symbols:  $p, q, r, \dots$ .
- ▶ Connective symbols:  $\neg, \wedge, \vee, \rightarrow, \leftrightarrow$ .

## Oral reading of logical connectives

$\neg$	not	negation
$\wedge$	and	conjunction
$\vee$	or	(inclusive) disjunction
$\rightarrow$	if, then (imply)	implication
$\leftrightarrow$	iff (equivalent to)	equivalence

- ▶ Punctuation symbols: ( and ).

## Expressions of $L^p$

- ▶ **expressions** are finite strings of symbols. Examples:  $p$ ,  $pq$ ,  $(r)$ ,  $p \wedge \rightarrow q$  and  $\neg(p \wedge q)$ .
- ▶ The **length** of an expression is the number of occurrences of symbols in it.
- ▶ **empty expression**: an expression of length 0, denoted by  $\lambda$ .
- ▶ two expressions  $u$  and  $v$  are **equal** if they are of the same length and have the same symbols in the same order.
- ▶ an expression is read from left to right.

# Expression terminologies

- ▶  $uv$  denotes the result of **concatenating** two expressions  $u, v$  in this order. Note that  $\lambda u = u\lambda = u$ .
- ▶  $v$  is a **segment** of  $u$  if  $u = w_1vw_2$  where  $u, v, w_1, w_2$  are expressions.

$v$  is a **proper segment** of  $u$  if  $v$  is non-empty and  $v \neq u$ .

If  $u = vw$ , where  $u, v, w$  are expressions, then  $v$  is an **initial segment (prefix)** of  $u$ . Similarly,  $w$  is a **terminal segment (suffix)** of  $u$ .

# Atomic formulas

## Definition ( $Atom(L^P)$ )

$Atom(L^P)$  is the set of expressions of  $L^P$  consisting of a proposition symbol only.

# Well-formed propositional formulas

## Definition ( $Form(L^P)$ )

An expression of  $L^P$  is a member of  $Form(L^P)$  if and only if its being so follows from (1) - (3):

1.  $Atom(L^P) \subseteq Form(L^P)$ .
2. If  $A \in Form(L^P)$ , then  $(\neg A) \in Form(L^P)$ .
3. If  $A, B \in Form(L^P)$ , then  $(A * B) \in Form(L^P)$  where  $*$  is one of the four binary connectives.

**Note that  $Form(L^P)$  is the minimum set that satisfies the three conditions above.**

# CQ on the first symbol in a well-formed formula

# CQ on well-formed propositional formulas

## Example: Generating Formulas

The following expression is a formula.

$$((p \vee q) \rightarrow ((\neg p) \leftrightarrow (q \wedge r)))$$

How is it generated using the definition of well-formed propositional formulas? One can use [parse trees](#) to analyze formulas.

## Example: Parse Tree

Draw the parse tree for the following formula.

$$((p \vee q) \rightarrow ((\neg p) \leftrightarrow (q \wedge r)))$$

Parse tree:

## Exercise: Parse Trees

Draw the parse tree for the following formula.

$$(((\neg p) \wedge q) \rightarrow (p \wedge (q \vee (\neg r))))$$

## Precedence rules: for humans

Consider the following sequence of connectives:

$$\neg, \wedge, \vee, \rightarrow, \leftrightarrow$$

Each connective on the left has priority over those on the right.

Examples: Add back the brackets based on the precedence rules.

▶  $\neg p \vee q$

▶  $p \wedge q \vee r$

▶  $p \rightarrow q \leftrightarrow p$

▶  $\neg p \rightarrow p \wedge \neg q \vee r \leftrightarrow q$

## Revisiting the learning goals

By the end of the lecture, you should be able to

- ▶ Determine whether an English sentence is a proposition.
- ▶ Determine whether an English sentence is a simple or compound proposition.
- ▶ Determine whether a propositional formula is atomic and/or well-formed.
- ▶ Draw the parse tree of a well-formed propositional formula.
- ▶ Given a propositional formula with no parentheses, make it a well-formed formula by adding parentheses according to the precedence rules.
