

csc2545 – Kernel Methods and Support Vector Machines

Description: The introduction of Support Vector Machines (SVMs) in the 1990s led to an explosion of applications and deepening theoretical analysis that have established SVMs as one of the standard tools for machine learning and data mining. They now deliver state-of-the-art performance in real-world applications such as text categorization, hand-written character recognition, image classification, bioinformatics, etc.

This course provides a comprehensive introduction to SVMs and other kernel methods, including theory, algorithms and applications. Topics covered will be selected from the following: support vector classification and regression; non-linear dimensionality reduction and feature extraction; reproducing kernel maps; robust estimation; regularization; statistical learning theory; convex optimization; implementation; designing kernels; applications.

Area: This course is in area 3A.

Prerequisites: Linear algebra, vector calculus, basic probability, and a willingness to program in Matlab. Mathematical maturity will be assumed.

Grading Scheme: There will be three or four assignments and possibly a final test. On all work, 20% of the mark will be for quality of presentation, including the use of good English. Late assignments will not be accepted.

Instructor: Anthony Bonner, email: `bonner [at] cs [dot] toronto [dot] edu`, office hours: by appointment. office: BA4268, phone: 416-978-7441, web site: `www.cs.toronto.edu/~bonner`.

Lectures: Monday and Thursday 3–4:30pm (sometimes 3–4pm) in BA3004 (Mondays) and MS4171 (Thursdays).
