## Lecture 2, Part 2: What is a system?

- ⇒ **Basic Principles:**
  - ↳ Everything is connected to everything else
  - ↳ You cannot eliminate the observer
  - ↳ Most truths are relative
  - ↳ Most views are complementary
- ⇒ **Defining Systems**
  - ↳ Elements of a system description
  - ↳ Example systems
  - ↳ Purposefulness, openness, hardness, ...
- ⇒ **Describing systems**
  - ↳ Choosing a boundary
  - ↳ Describing behaviour

## General Systems Theory

- ⇒ **How scientists understand the world:**
  - ↳ Reductionism - break a phenomena down into its constituent parts
    - ↳ E.g. reduce to a set of equations governing interactions
  - ↳ Statistics - measure average behaviour of a very large number of instances
    - ↳ E.g. gas pressure results from averaging random movements of zillions of atoms
    - ↳ Error tends to zero when the number of instances gets this large
- ⇒ **But sometimes neither of these work:**
  - ↳ Systems that are too interconnected to be broken into parts
  - ↳ Behaviour that is not random enough for statistical analysis
- ⇒ **General systems theory**
  - ↳ Originally developed for biological systems:
    - ↳ E.g. to understand the human body, and the phenomena of 'life'
  - ↳ Basic ideas:
    - ↳ Treat inter-related phenomena as a system
    - ↳ Study the relationships between the pieces and the system as a whole
    - ↳ Don't worry if we don't fully understand each piece

University of Toronto Department of Computer Science

## Role of the Observer

- ⇒ **Achieving objectivity in scientific inquiry**
  1. Eliminate the observer
    - ↳ E.g. ways of measuring that have no variability across observers
  2. Distinguish between scientific reasoning and value-based judgement
    - ↳ Science is (supposed to be) value-free
    - ↳ (but how do scientists choose which theories to investigate?)
- ⇒ **For complex systems, this is not possible**
  - ↳ Cannot fully eliminate the observer
    - ↳ E.g. Probe effect - measuring something often changes it
    - ↳ E.g. Hawthorne effect - people react to being studied
  - ↳ Our observations biased by past experience
    - ↳ We look for familiar patterns to make sense of complex phenomena
    - ↳ E.g. try describing someone's accent
- ⇒ **Achieving objectivity in systems thinking**
  - ↳ Study the relationship between observer and observations
  - ↳ Look for observations that make sense from many perspectives

© Easterbrook 2004 3

University of Toronto Department of Computer Science

## Relativism

- ⇒ **Truth is relative to many things**
  - ↳ The meanings of the words we use
    - ↳ E.g. law of gravity depends on correct understanding of "mass", "distance", "force" etc
  - ↳ The assumptions we make about context
    - ↳ E.g. law of gravity not applicable at subatomic level, or near the speed of light
    - ↳ E.g. Which is the step function:

The agricultural revolution

Transistor switching

© Easterbrook 2004 4

University of Toronto Department of Computer Science

## Relativism is everywhere

- ⇒ Truth often depends on the observer
  - ↳ “Emergent properties of a system are not predictable from studying the parts”
    - > Whose ability to predict are we talking about?
  - ↳ “Purpose of a system is a property of the relationship between system & environment”
    - > What is the purpose of: General Motors? A University? A birthday party?
- ⇒ Weltanschauungen (~ “worldviews”)
  - ↳ Our Weltanschauungen permeate everything
    - > The set of categories we use for understanding the world
    - > The language we develop for describing what we observe
- ⇒ Ethno-centrism (or ego-centrism)
  - ↳ The tendency to assume one’s own category system is superior
    - > E.g. “In the land of the blind, the one-eyed man is king”
    - > But what use would visually-oriented descriptions be in this land?

© Easterbrook 2004 5

University of Toronto Department of Computer Science

## The principle of complementarity

- ⇒ Raw observation is too detailed
  - ↳ We systematically ignore many details
    - > E.g. the idea of a ‘state’ is an abstraction
  - ↳ All our descriptions (of the world) are partial, filtered by:
    - > Our perceptual limitations
    - > Our cognitive ability
    - > Our personal values and experience
- ⇒ Complementarity:
  - ↳ Two observers’ descriptions of system may be:
    - > Redundant – if one observer’s description can be reduced to the other
    - > Equivalent – if redundant both ways
    - > Independent – if there is no overlap at all in their descriptions
    - > Complementary – if none of the above hold
  - ↳ Any two partial descriptions (of the same system) are likely to be complementary
  - ↳ Complementarity should disappear if we can remove the *partiality*
    - > E.g. ask the observers for increasingly detailed observations
  - ↳ But this is not always possible/feasible

© Easterbrook 2004 6

University of Toronto Department of Computer Science

## Definition of a system

- ⇒ Ackoff’s definition:
  - ↳ “A system is a set of two or more elements that satisfies the following conditions:
    - > The behaviour of each element has an effect on the behaviour of the whole
    - > The behaviour of the elements and their effect on the whole are interdependent
    - > However subgroups of elements are formed, each has an effect on the behaviour of the whole and none has an independent effect on it”
- ⇒ Other views:
  - ↳ Weinberg: “A system is a collection of parts, none of which can be changed on its own”
    - > ...because the parts of the system are so interconnected
  - ↳ Wieringa: “A system is any actual or possible part of reality that, if it exists, can be observed”
    - > ...suggests the importance of an observer
  - ↳ Weinberg: “A system is a way of looking at the world”
    - > Systems don’t really exist!
    - > Just a convenient way of describing things (like ‘sets’)

© Easterbrook 2004 7

University of Toronto Department of Computer Science

## Elements of a system

- ⇒ Boundary
  - ↳ Separates a system from its environment
  - ↳ Often not sharply defined
  - ↳ Also known as an “interface”
- ⇒ Environment
  - ↳ Part of the world with which the system can interact
  - ↳ System and environment are inter-related
- ⇒ Observable Interactions
  - ↳ How the system interacts with its environment
  - ↳ E.g. inputs and outputs
- ⇒ Subsystems
  - ↳ Can decompose a system into parts
  - ↳ Each part is also a system
  - ↳ For each subsystem, the remainder of the system is its environment
  - ↳ Subsystems are inter-dependent
- ⇒ Control Mechanism
  - ↳ How the behaviour of the system is regulated to allow it to endure
  - ↳ Often a natural mechanism
- ⇒ Emergent Properties
  - ↳ Properties that hold of a system, but not of any of the parts
  - ↳ Properties that cannot be predicted from studying the parts

- ## Hard vs. Soft Systems
- ### Hard Systems:

  - ⊃ The system is...
    - ⊗ ...precise,
    - ⊗ ...well-defined
    - ⊗ ...quantifiable
  - ⊃ No disagreement about:
    - ⊗ Where the boundary is
    - ⊗ What the interfaces are
    - ⊗ The internal structure
    - ⊗ Control mechanisms
    - ⊗ The purpose ??
  - ⊃ Examples
    - ⊗ A car (?)

### Soft Systems:

  - ⊃ The system...
    - ⊗ ...is hard to define precisely
    - ⊗ ...is an abstract idea
    - ⊗ ...depends on your perspective
  - ⊃ Not easy to get agreement
    - ⊗ The system doesn't "really" exist
    - ⊗ Calling something a system helps us to understand it
    - ⊗ Identifying the boundaries, interfaces, controls, helps us to predict behaviour
    - ⊗ The "system" is a theory of how some part of the world operates
  - ⊃ Examples:
    - ⊗ All human activity systems

## Scoping a system

⇒ Choosing the boundary

- ☞ Distinction between system and environment depends on your viewpoint
- ☞ Choice should be made to maximize modularity
- ☞ Examples:
  - Telephone system - include: switches, phone lines, handsets, users, accounts?
  - Desktop computer - do you include the peripherals?
- ☞ Tips:
  - Exclude things that have no functional effect on the system
  - Exclude things that influence the system but which cannot be influenced or controlled by the system
  - Include things that can be strongly influenced or controlled by the system
  - Changes within a system should cause minimal changes outside
  - More 'energy' is required to transfer something across the system boundary than within the system boundary

⇒ System boundary should 'divide nature at its joints'

- ☞ Choose the boundary that:
  - increases regularities in the behaviour of the system
  - simplifies the system behavior

University of Toronto Department of Computer Science

## Describing System Behaviour

⇒ State

- ☞ a system will have memory of its past interactions, i.e. 'state'
- ☞ the state space is the collection of all possible states

⇒ Discrete vs continuous

- ☞ a discrete system:
  - the states can be represented using natural numbers
- ☞ a continuous system:
  - state can only be represented using real numbers
- ☞ a hybrid system:
  - some aspects of state can be represented using natural numbers

⇒ Observability

- ☞ the state space is defined in terms of the observable behavior
- ☞ the perspective of the observer determines which states are observable
