Lecture 8: Stakeholder Goals

- ⇒ Boundaries
 - **♦ Scoping the problem**
- Stakeholders
 - ⋄ I dentifying the problem owners
- ⇒ Goals
 - ∀ Identifying the success criteria
- ⇒ Scenarios
 - **♥** Using concrete examples to understand the problem

Where do we start?

- ⇒ Identify the problem
 - \$\ \what is the objective of the project?
 - \$ the "vision" of those who are pushing for it?
 - > e.g., "Meeting scheduling is too costly right now"
- Scope the problem
 - \$ given the vision, how much do we tackle?
 - > e.g. "Build a system that schedules meetings", ...or...
 - e.g. "Build a system that maintains people's calendars" ...or...
- Choose a business process ?
 - bgiven the problem, what is the appropriate business process for solving it?
 - > e.g. "Anyone who wants to schedule a meeting goes to the secretary, gives
 - details and the secretary handles the rest", ...or...
 - > e.g. "Anyone can submit a meeting request, participants are informed and a negotiation settles meeting details" ...or...
- Choose among alternatives ?
 - \$\\$ Given a business process, what parts should be automated, and how?

 - > e.g. "Computer takes in scheduling request details, outputs a solution" ...or... > e.g. "Solution arrived at interactively by secretary and computer" ...or...

Requirements Elicitation

⇒ Starting point

- Some notion that there is a "problem" that needs solving
 - > e.g. dissatisfaction with the current state of affairs
 - > e.g. a new business opportunity
 - > e.g. a potential saving of cost, time, resource usage, etc.

Collect enough information to:

- ⋄ identify the "problem"/"opportunity"
 - > Which problem needs to be solved? (identify problem Boundaries)
 - > Where is the problem? (understand the Context/Problem Domain)
 - > Whose problem is it? (identify Stakeholders)
 - > Why does it need solving? (identify the stakeholders' Goals)
 - > How does the problem manifest itself? (collect some Scenarios)
 - When does it need solving? (identify Development Constraints)
 - > What might prevent us solving it? (identify Feasibility and Risk)

become an expert in the problem domain

- > Learn how to find your way round a new problem area quickly
- > Use your (initial) ignorance as an excuse to ask questions
- > Recognise the domain expertise of the people you talk to

W₆H

The journalist's technique:

What? Where?

Who? Why?

When? How?

(Which?)

Identifying the Problem

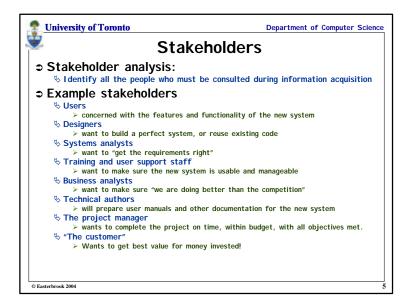

⇒ Vague problem stated by the customer:

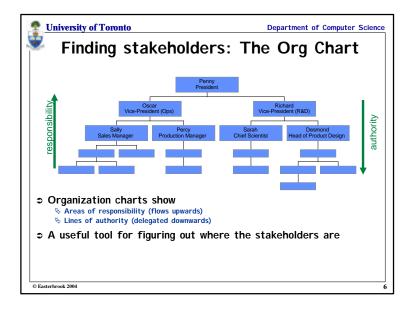

- ♥ E.g. university textbook store:
- Manager wants to computerize the book order forms filled out by instructors;
- ♥ E.g. A large insurance company:
 - > Claims manager wants to cut down the average time it takes to process an insurance claim from 2 months to 2 weeks
- ♥ E.g. A telecommunications company:
 - > CIO wants to integrate the billing system with customer record systems of several affiliates, so there is only one billing system...
- ♥ E.g. Large Government Aerospace Agency:
 - > The president wants to send a manned mission to Mars by the the year 2020

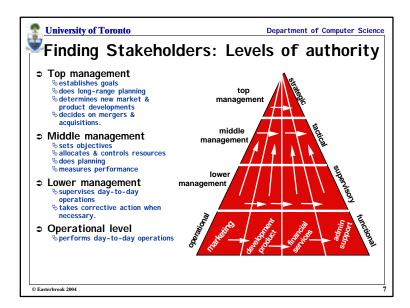

⇒ Often you only see symptoms rather than causes:

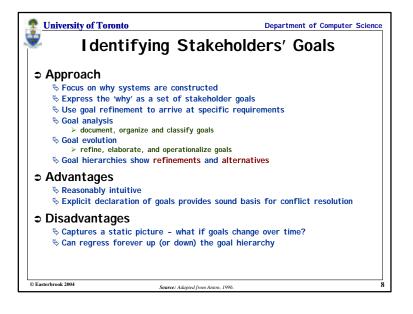

- ♥ E.g. "Ontario patients needing X-ray scans have to wait for months"
- & The long wait is the symptom, not the problem. The problem may be:
 - Shortage of X-ray machines;
 - Shortage of trained staff:
 - > Shortage of doctors to process the data
 - > Inefficient scheduling procedures

Department of Computer Science

Scenarios

⇒ Scenarios

- ♦ Specific sequence of interaction between actor and system
- ♦ Tend to be short (e.g between 3 and 7 steps)
- ⋄ May be:
 - positive (i.e. required behavior)
 - > negative (i.e an undesirable interaction)

⇒ Advantages

- ♦ Very natural: stakeholders tend to use them spontaneously
 - > E.g "suppose I'm admitted to hospital what happens during my admission?"
 - > Typical answer: "You, or the person accompanying you would talk to the person at the admissions desk. You have to show your OHIP card and explain who referred you to the hospital. Then you..." [and so on]
- ♦ Short scenarios very good for quickly illustrating specific interactions

⇒ Disadvantages

♦ Lack of structure:

Example Scenario

Title: Successful meeting scheduled using messaging option Participants: Alice (initiator, not attending); Bob, Carlo, Daphne (attendees)		
Action	Goals satisfied	Obstacles / Problems
Alice requests meeting, specifying participants, timeframe	Meeting requested; Attendee list obtained	What if selected timeframe is infeasible?
AS sends participant requests to Bob, Carlo and Daphne	?	Did we miss a goal?
Bob reads message	Participants informed	Can't detect when messages are read; what happens if Bob reads the message but doesn't reply?
Carlo reads message		
Daphne reads message		
Bob replies with preferences	Attendees preferences known	What if the preferences are mutually exclusive? Should we allow some to be higher priority?
Carlo replies with preferences		
Daphne replies with preferences		
AS schedules meeting	Room availability determined; room booked	
AS notifies Alice, Bob, Carlo, Daphne of time and location	Meeting announced; Attendance Confirmed (?)	How do we know if they've all read the announcement? What if the schedule is no longer convenient for one of them?
