Lecture 11: Requirements Modelling

- ⇒ A little refresher:
 - ↳ What are we modelling?
 - ↳ Requirements; Systems; Systems Thinking
- ⇒ Role of Modelling in RE
 - ↳ Why modelling is important
 - ↳ Limitations of modelling
- ⇒ Brief overview of modelling languages
- ⇒ Modelling principles
 - ↳ Abstraction
 - ↳ Decomposition
 - ↳ Projection
 - ↳ Modularity

Refresher: Definitions

Application Domain Machine Domain

D - domain properties R - requirements

C - computers P - programs

S - specification

- ⇒ Some distinctions:
 - ↳ Domain Properties - things in the application domain that are true whether or not we ever build the proposed system
 - ↳ Requirements - things in the application domain that we wish to be made true by delivering the proposed system
 - ↳ A specification - a description of the behaviours the program must have in order to meet the requirements
- ⇒ Two correctness (verification) criteria:
 - ↳ The Program running on a particular Computer satisfies the Specification
 - ↳ The Specification, in the context of the given domain properties, satisfies the requirements
- ⇒ Two completeness (validation) criteria:
 - ↳ We discovered all the important requirements
 - ↳ We discovered all the relevant domain properties

Modelling...

- ⇒ Modelling can guide elicitation:
 - ↳ It can help you figure out what questions to ask
 - ↳ It can help to surface hidden requirements
 - > i.e. does it help you ask the right questions?
- ⇒ Modelling can provide a measure of progress:
 - ↳ Completeness of the models -> completeness of the elicitation (?)
 - > i.e. if we've filled in all the pieces of the models, are we done?
- ⇒ Modelling can help to uncover problems
 - ↳ Inconsistency in the models can reveal interesting things...
 - > e.g. conflicting or infeasible requirements
 - > e.g. confusion over terminology, scope, etc
 - > e.g. disagreements between stakeholders
- ⇒ Modelling can help us check our understanding
 - ↳ Reason over the model to understand its consequences
 - > Does it have the properties we expect?
 - ↳ Animate the model to help us visualize/validate the requirements

RE involves a lot of modelling

- ⇒ A model is more than just a description
 - ↳ it has its own phenomena, and its own relationships among those phenomena.
 - > The model is only useful if the model's phenomena correspond in a systematic way to the phenomena of the domain being modelled.
 - ↳ Example:

"It's only a model"

- ⇒ There will always be:
 - ↳ phenomena in the model that are not present in the application domain
 - ↳ phenomena in the application domain that are not in the model

- ⇒ A model is never perfect
 - ↳ "If the map and the terrain disagree, believe the terrain"
 - ↳ Perfecting the model is not always a good use of your time...

Choice of modelling notation

- ⇒ natural language
 - ↳ extremely expressive and flexible
 - > useful for elicitation, and to annotate models for readability
 - ↳ poor at capturing key relationships
- ⇒ semi-formal notation
 - ↳ captures structure and some semantics
 - ↳ can perform (some) reasoning, consistency checking, animation, etc.
 - > E.g. diagrams, tables, structured English, etc.
 - ↳ mostly visual - for rapid communication with a variety of stakeholders
- ⇒ formal notation
 - ↳ precise semantics, extensive reasoning possible
 - > Underlying mathematical model (e.g. set theory, FSMs, etc)
 - ↳ very detailed models (may be more detailed than we need)
 - > RE formalisms are for conceptual modelling, hence differ from most computer science formalisms

University of Toronto Department of Computer Science

Desiderata for Modelling Notations

- ⇒ **Implementation Independence**
 - ↳ does not model data representation, internal organization, etc.
- ⇒ **Ease of analysis**
 - ↳ ability to analyze for ambiguity, incompleteness, inconsistency
- ⇒ **Abstraction**
 - ↳ extracts essential aspects
 - ↳ e.g. things not subject to frequent change
- ⇒ **Traceability**
 - ↳ ability to cross-reference elements
 - ↳ ability to link to design, implementation, etc.
- ⇒ **Formality**
 - ↳ unambiguous syntax
 - ↳ rich semantic theory
- ⇒ **Executability**
 - ↳ can animate the model, to compare it to reality
- ⇒ **Constructability**
 - ↳ can construct pieces of the model to handle complexity and size
 - ↳ construction should facilitate communication
- ⇒ **Minimality**
 - ↳ No redundancy of concepts in the modelling scheme
 - ↳ i.e. no extraneous choices of how to represent something

Survey of Modelling Techniques

- ⇒ **Modelling Enterprises**
 - ↳ Goals & objectives
 - ↳ Organizational structure
 - ↳ Tasks & dependencies
 - ↳ Agents, roles, intentionality
- ⇒ **Modelling Information & Behaviour**
 - ↳ Information Structure
 - ↳ Behavioral views
 - > Scenarios and Use Cases
 - > State machine models
 - > Information flow
 - ↳ Timing/Sequencing requirements
- ⇒ **Modelling System Qualities (NFRs)**
 - ↳ All the 'ilities':
 - > Usability, reliability, evolvability, safety, security, performance, interoperability,...

Organization modelling:
i*, SSM, I SAC
Goal modelling:
KAOS, CREWS

Information modelling:
E-R, Class Diagrams
Structured Analysis:
SADT, SSADM, JSD
Object Oriented Analysis:
OOA, OOSE, OMT, UML
Formal Methods:
SCR, RSML, Z, Larch, VDM

Quality tradeoffs:
QFD, win-win, AHP,
Specific NFRs:
Timed Petri nets (performance)
Task models (usability)
Probabilistic MTTF (reliability)

the Unified Modelling Language (UML)

- ⇒ **Third generation OO method**
 - ↳ Booch, Rumbaugh & Jacobson are principal authors
 - > Still evolving
 - > Attempt to standardize the proliferation of OO variants
 - ↳ Is purely a notation
 - > No modelling method associated with it!
 - > Was intended as a design notation (some features unsuitable for RE)
 - ↳ Has become an industry standard
 - > But is primarily owned by Rational Corp. (who sell lots of UML tools and services)
- ⇒ **Has a standardized meta-model**
 - ↳ Use case diagrams
 - ↳ Class diagrams
 - ↳ Message sequence charts
 - ↳ Activity diagrams
 - ↳ State Diagrams
 - ↳ Module Diagrams
 - ↳ Platform diagrams

© Easterbrook 2004

University of Toronto Department of Computer Science

Meta-Modelling

- ⇒ **Can compare modelling schema using meta-models:**
 - ↳ What phenomena does each scheme capture?
 - ↳ What guidance is there for how to elaborate the models?
 - ↳ What analysis can be performed on the models?
- ⇒ **Example meta-model:**

© Easterbrook 2004

University of Toronto Department of Computer Science

Modelling principles

- ⇒ **Facilitate Modification and Reuse**
 - ↳ Experienced analysts reuse their past experience
 - > they reuse components (of the models they have built in the past)
 - > they reuse structure (of the models they have built in the past)
 - ↳ Smart analysts plan for the future
 - > they create components in their models that might be reusable
 - > they structure their models to make them easy to modify
- ⇒ **Helpful ideas:**
 - ↳ **Abstraction**
 - > strip away detail to concentrate on the important things
 - ↳ **Decomposition (Partitioning)**
 - > Partition a problem into independent pieces, to study separately
 - ↳ **Viewpoints (Projection)**
 - > Separate different concerns (views) and describe them separately
 - ↳ **Modularization**
 - > Choose structures that are stable over time, to localize change
 - ↳ **Patterns**
 - > Structure of a model that is known to occur in many different applications

© Easterbrook 2004 13

University of Toronto Department of Computer Science

Modelling Principle 1: Partitioning

- ⇒ **Partitioning**
 - ↳ captures aggregation/part-of relationship
- ⇒ **Example:**
 - ↳ goal is to develop a spacecraft
 - ↳ partition the problem into parts:
 - > guidance and navigation;
 - > data handling;
 - > command and control;
 - > environmental control;
 - > instrumentation;
 - > etc
 - ↳ **Note: this is not a design, it is a problem decomposition**
 - > actual design might have any number of components, with no relation to these sub-problems
 - ↳ However, the choice of problem decomposition will probably be reflected in the design

© Easterbrook 2004 14

University of Toronto Department of Computer Science

Modelling Principle 2: Abstraction

- ⇒ **Abstraction**
 - ↳ A way of finding similarities between concepts by ignoring some details
 - ↳ Focuses on the general/specific relationship between phenomena
 - > Classification groups entities with a similar role as members of a single class
 - > Generalization expresses similarities between different classes in an 'is_a' association
- ⇒ **Example:**
 - ↳ requirement is to handle faults on the spacecraft
 - ↳ might group different faults into fault classes

based on location: **OR** based on symptoms:

<ul style="list-style-type: none"> ↳ instrumentation fault, ↳ communication fault, ↳ processor fault, ↳ etc 	<ul style="list-style-type: none"> ↳ no response from device; ↳ incorrect response; ↳ self-test failure; ↳ etc...
---	---

University of Toronto Department of Computer Science

Modelling Principle 3: Projection

- ⇒ **Projection:**
 - ↳ separates aspects of the model into multiple viewpoints
 - > similar to projections used by architects for buildings
- ⇒ **Example:**
 - ↳ Need to model the requirements for a spacecraft
 - ↳ Model separately:
 - > safety
 - > commandability
 - > fault tolerance
 - > timing and sequencing
 - > Etc...
- ⇒ **Note:**
 - ↳ Projection and Partitioning are similar:
 - > Partitioning defines a 'part of' relationship
 - > Projection defines a 'view of' relationship
 - ↳ Partitioning assumes a the parts are relatively independent

- University of Toronto Department of Computer Science
- ## Summary
- ⇒ **Modelling plays a central role in RE**
 - ↳ Allows us to study a problem systematically
 - ↳ Allows us to test our understanding
 - ⇒ **Many choices for modelling notation**
 - ↳ In this course, we'll use (and adapt) various UML notations
 - ⇒ **All models are inaccurate** (to some extent)
 - ↳ Use successive approximation
 - ↳ ...but know when to stop perfecting the model
 - ↳ Every model is created for a purpose
 - ↳ The purpose is not usually expressed in the model
 - ↳ ...So every model needs an explanation
