

Leveraging Information Visualization Techniques and Driving Statistics for Influencing User Behaviour

Hazem, Rifat, Tushar, Yasaman
April 29th, 2019

Introduction/ Motivation

Introduction and Motivation

- Future of ground transportation
- Powerful computational resources (i.e. deep learning)
- Goal: safe transportation
- Challenge: safety
- Current state: Drivers are still responsible for safe operation

Introduction and Motivation (cont.)

- Drivers are not playing their parts
- Companies deny responsibility
- AV research focus more on the machine and less on the human
- Ultimately, the goal is to improve human safety in AVs. We want to look at this problem from a different standpoint, by looking to improve human performance rather than vehicle performance.
- Our goal: help drivers train themselves to improve their driving behavior by giving them a means to contextually understand their driving performance.

Literature Review

Related Work

Safety of Autonomous Vehicle, Ergonomics, and HCI

- Contextual awareness, safety, perception, warning systems, and communication tools and techniques
- Positive cues in intelligent user interfaces increase learners' inductive capability (Hoc et al.)
- Measuring drivers' situational awareness in real time - both on-board and in simulated environments (Sirkin et al.)
- People's perception of safety in terms of design elements of warning systems (Li et al.)
- Pedestrians most clearly understood the information communicated via textual eHMI over other mediums (i.e., Knightrider, smiley, front brake) (de Clercq)

Related Work

Safety of Autonomous Vehicle, Ergonomics, and HCI

- Contextual awareness, safety, perception, warning systems, and communication tools and techniques
- Positive Limitations in terms of generalizability, design choices, and users' responsiveness. ve capability (Hess et al.)
- Measuring drivers' situational awareness in real time - both on-board and in simulated environments (Sirkin et al.)
- People's perception of safety in terms of design elements of warning systems (Li et al.)
- Pedestrians most clearly understood the information communicated via textual eHMI over other mediums (i.e., Knightrider, smiley, front brake) (de Clercq)

Related Work (cont.)

Persuasion and Visualization

- How persuasion influence human behavior
- People change their behavior when they see evidence, especially statistical evidence and when they are already persuaded in some ways (Pandey et al.)
- Motivational, instructional, and supportive intervention techniques for workplaces for effective behavior changes (Yun et al.)

Related Work (cont.)

Gamification

- Applied to other contexts such as motivation, engagement, education, steering users' behavior (Jent and Janneck)
- Badging: one of the main behavior-modification mechanisms (Hamari et al.)
 - Positive effect on user behavior (Anderson et al., Bornfeld and Rafaeli, Hamari)

Proposed System

Requirements

The system must:

1. Visualize individual journey information
2. Visualize aggregate journey statistics
3. Enable users to infer relative driving performance
4. Motivate users to drive more safely

Datasets Used

1. San Francisco Speed Limit Dataset

- a. Coordinates on streets and associated speed limits and average speeds

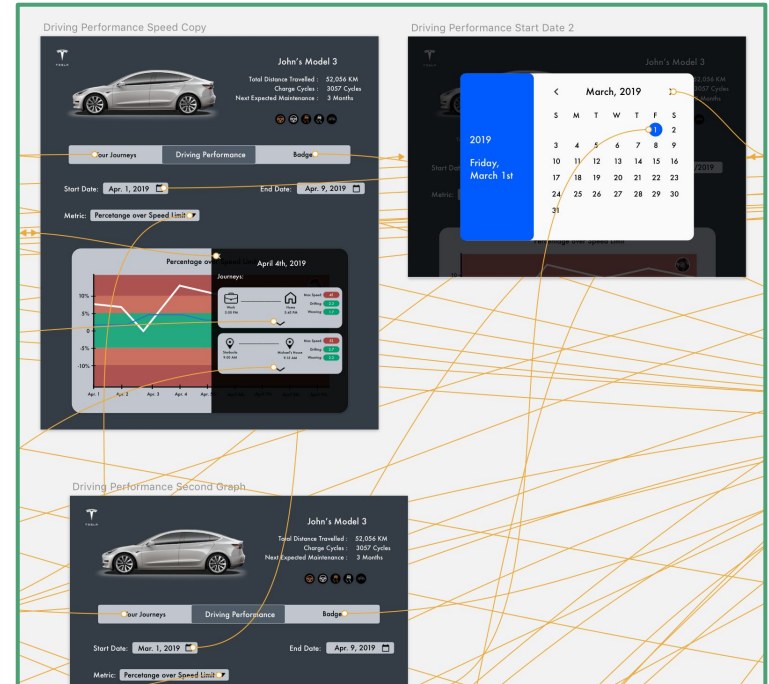

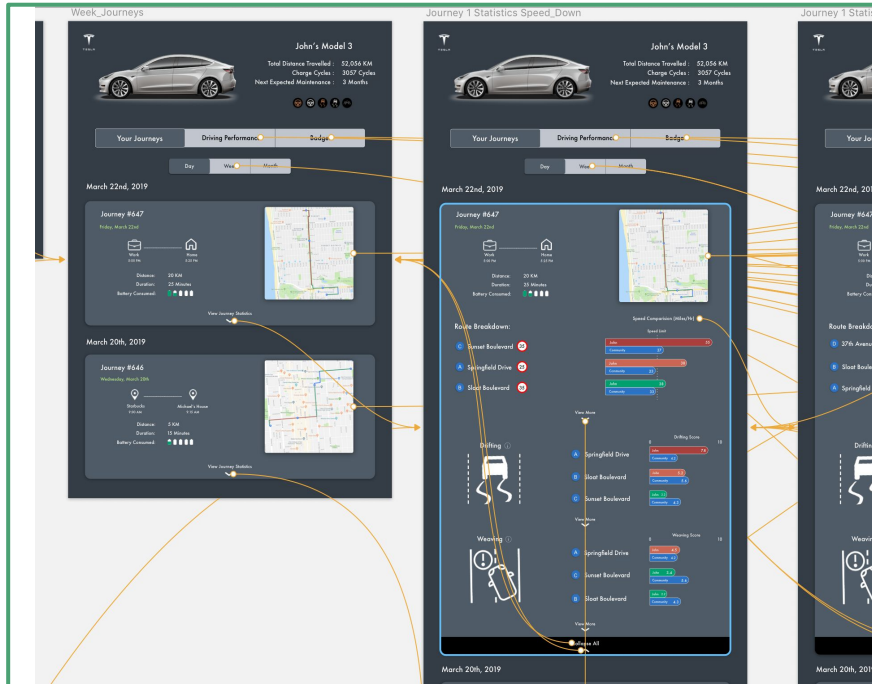

2. UAH Driving Dataset

- a. Raw information from accelerometer and GPS
- b. Processed information scores for weaving, drifting, acceleration, breaking, turning, and overspeeding
- c. Identification of normal, drowsy, and aggressive behavior

Design Overview

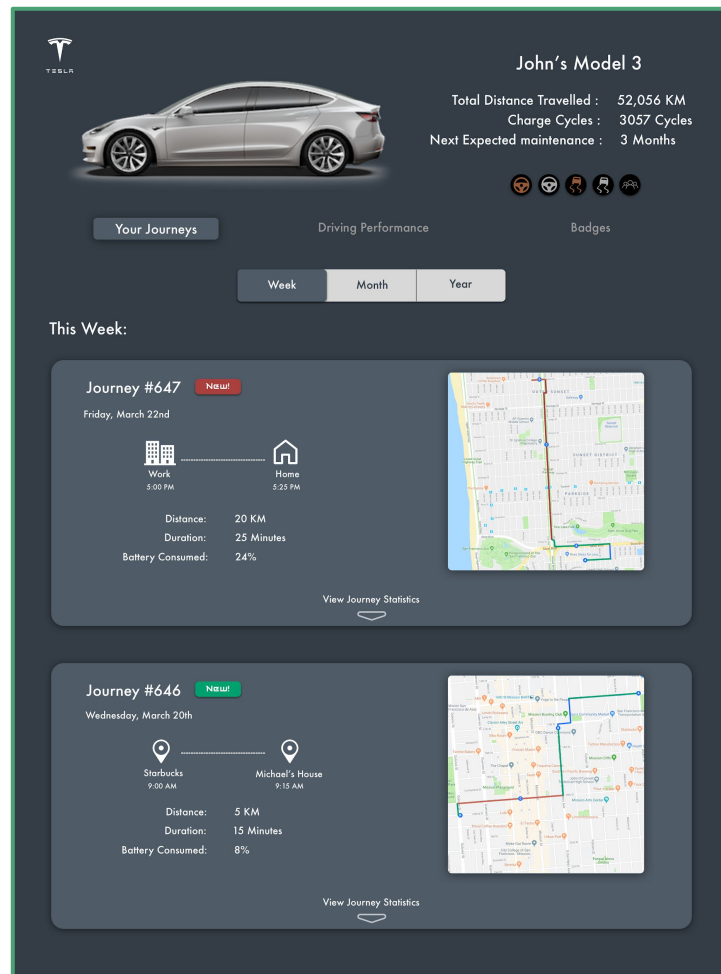

Interaction Prototyping

Design

1. Visualize individual journey information
2. Visualize aggregate journey statistics
3. Enable users to infer relative driving performance
4. Motivate users to drive more safely

Usability Testing

Moderated UX Testing

1. Participants

- a. 10 participants (7 Male, 3 Female)
- b. Age: 24 - 33; Demographic: Canadian, Chinese, Brazilian, Iranian, and others
- c. Everyone with significant driving experience (2 - 15 years)

2. Methods

- a. Heuristic Evaluation: measure of ease for navigation and finding information
- b. Qualitative Questionnaire: most visible information and ways of improvement

3. Feedback

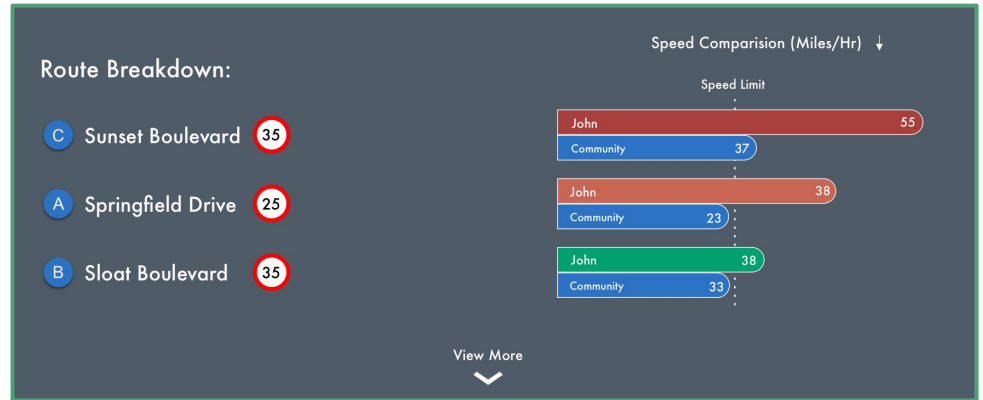

- a. Impact on safe driving
- b. Chances of using the system

Key Findings

1. Graphical Representation
2. Design Element Visibility
3. Icons and Tags
4. Consistency

Key Findings

1. Graphical Representation
2. Design Element Visibility
3. Icons and Tags
4. Consistency

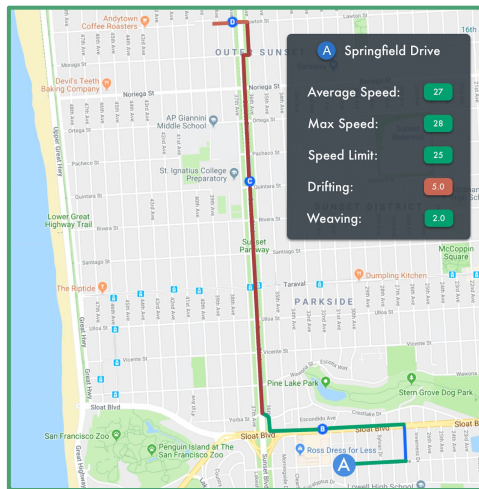

Key Findings

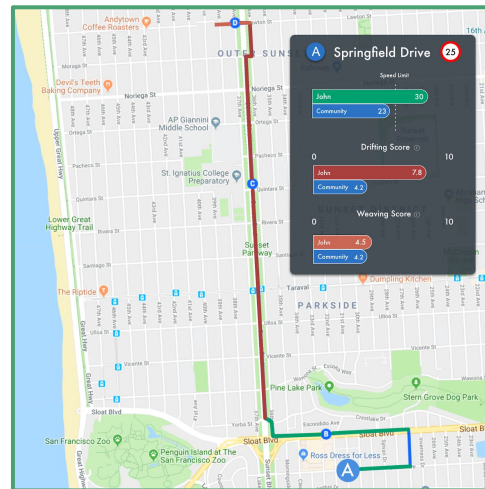

1. Graphical Representation

“Speed limits can be displayed as a graph; [currently there are] too much information (which can be somewhat misleading) and too many numbers.”

Battery Consumed: 24%

2. Design Element Visibility
3. Icons and Tags
4. Consistency

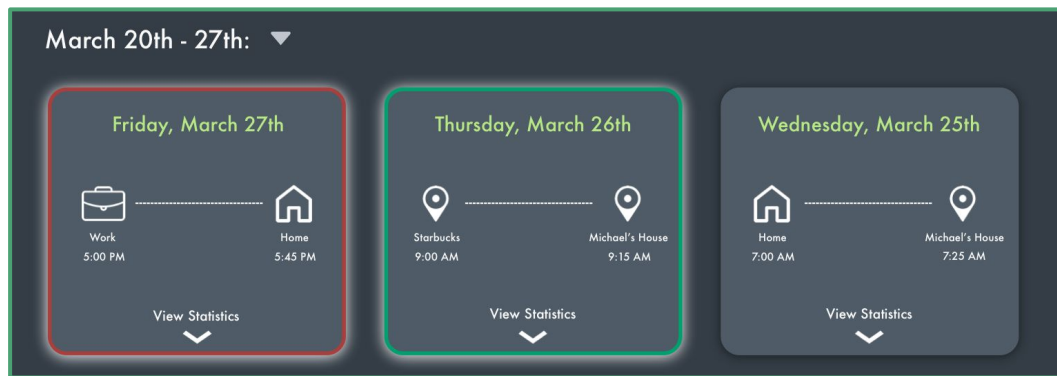

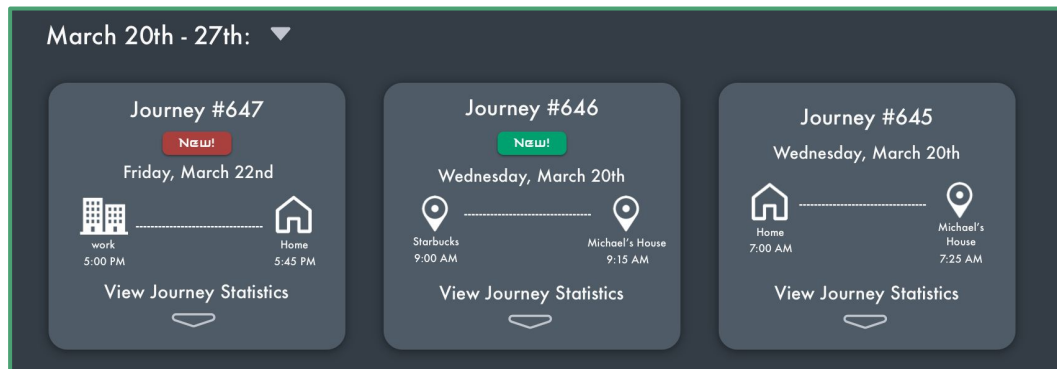

Key Findings

3. Icons and Tags

“The color of the tags are not meaningful enough. Maybe trying to give two types of information through one tag is not a good idea.”

“The ‘new’ is confusing; instead, circle the entire thing.”

Key Findings

1. Graphical Representation
2. Design Element Visibility
3. Icons and Tags
4. **Consistency**

Key Findings

4. Consistency

“Maybe put up a question mark with the weaving and drifting. If I’m in any page and I am confused, I can look up the definition instantly.”
