A DATASET FOR
DYNAMIC DISCOVERY OF SEMANTIC CHANGES
IN VERSION CONTROLLED SOFTWARE HISTORIES

MSR
MAY 21, 2017

Chenguang Zhu        Yi Li
Julia Rubin          Marsha Chechik
Goal: Given a version-controlled software history, identify code changes related to a particular high-level functionality.

Uses:
- Assist in transferring functionalities across branches
- Produce focused pull-requests
- Locate features [SPLC’17]
- Etc.

Semantic History Slice: A (minimal) sub-sequence of a change history that preserves the functionality of interest as defined by a set of test cases. [ASE’15, ASE’16, TSE’17]

https://github.com/Chenguang-Zhu/DoSC
CHALLENGES IN EVALUATING SEMANTIC HISTORY SLICING

- Need a significant number of well-documented functionalities
- Functionalities should be accompanied by test cases
- Need ground truth

Contribution of this work:
- 98 items of semantic change data, collected from 10 open-source Java projects.

DATASET CREATION

- Chose well-documenting projects
  - 10 Apache Java projects, using JIRA for issue tracking

- Chose projects with test cases
  - Functionalities committed together with a test suite

- Obtained ground truth
  - Ran a delta debugging-style partitioning algorithm, to produce 1-minimal slices
    - 1-minimal – removing a single commit makes the result invalid

https://github.com/Chenguang-Zhu/DoSC
DATA SCHEMA

Meta-data: YAML

Example: CALCITE-1168

```yaml
id: CALCITE-1168
description: Add DESCRIBE SCHEMA/DATABASE/TABLE/query
project:
  name: Calcite
  project url: https://github.com/MSR-2017/calcite
issue url: https://issues.apache.org/jira/browse/CALCITE-1168
history start: 8eebfc6d
history end: aeb6bf14
test suite:
  - "SqlParserTest.testDescribeSchema"
  - "SqlParserTest.testDescribeTable"
  - "SqlParserTest.testDescribeStatement"
history slice:
  - "a065200a"
  - "da875a67"
developer labeled commits:
  - "a065200a"
  - "da875a67"
```

https://github.com/Chenguang-Zhu/DoSC
1. Pick a functionality (e.g., CALCITE-1168), view the meta-data.

2. Clone the project repository to the local machine.

3. Extract all test cases defining the functionality.

F1

TestA

TestB.testf()  

TestC.testg()  

...

[GitHub Link](https://github.com/Chenguang-Zhu/DoSC)
4. Extract the starting point and the ending point of the history segment (SHA-1-expressed commit number)

5. Using the selected test cases (Step 3) and history segment (Step 4) as input, run the history slicing/feature location tool to be evaluated

https://github.com/Chenguang-Zhu/DoSC
6. Compare the obtained result with ground truth we provide

1) Semantic History Slicing:

User’s result

2) Feature location:

User’s result

STATUS

URL: https://github.com/Chenguang-Zhu/DoSC

Contents
• Meta-data template
• 98 pieces of data
• Our tool for obtaining 1-minimal history slice

Easy to extend
• ... e.g., by including more repositories
• ... or by adding histories containing bugs and failed test cases – for fault localization

WE LOOK FORWARD TO YOUR USES AND EXTENSIONS!!!!!
Thank you!
