
Makefiles

Compiling without Make

Say we have a program broken into two files (prog.c and sub.c), and each begins with

```
#include "incl.h"
```

We can compile the program in one line:

```
eddie% gcc prog.c sub.c
```

Or we can compile the parts separately:

```
eddie% gcc -c prog.c  
eddie% gcc -c sub.c  
eddie% gcc prog.o sub.o
```

Reading:

- King, chapter 15

There's not much point to doing it separately, except when only parts of the program need to be recompiled.

E.g., say I've changed `sub.c` and nothing else. I don't need to recompile `prog.c`.

```
eddie% gcc -c sub.c
eddie% gcc prog.o sub.o
```

This becomes really valuable when we have many files. But then it becomes hard to keep track of what needs to be recompiled.

This is what makefiles help us with.

Makefiles

General format: A makefile consists of pairs of lines as follows:

```
label: item1 ... itemk
      command
```

Meaning: To ensure that *label* is up to date:

1. Recursively ensure that *item1* ... *itemk* are themselves up to date.
2. If file *label* is older than any of the files *item1* ... *itemk*, then file *label* is out of date. Execute *command* to bring it up to date.

Example:

```
pgm: prog.o sub.o
    gcc -o pgm prog.o sub.o
prog.o: incl.h prog.c
    gcc -c prog.c
sub.o: incl.h sub.c
    gcc -c sub.c
```

Running make

```
Script started on Sun Jan 19 17:13:22 1997
eddie% ls
README      makefile    prog.c      typescript
incl.h      pgm         sub.c
eddie% make
gcc -c prog.c
gcc -c sub.c
gcc -o pgm prog.o sub.o

eddie% vi incl.h
gcc -c prog.c
gcc -c sub.c
gcc -o pgm prog.o sub.o

eddie% pgm
hi
hi
hi
there
there
there

eddie% vi prog.c
eddie% ls -l
total 15

-rw----- 1 dianeh 0 Jan 19 17:13 typescript
```

Tabs are Crucial

You absolutely must put a tab before each compile command. If you use blanks instead, you will get an unhelpful message.

Example

Here's a silly makefile. The white space before the `g++` command is made of blanks.

```
% cat diane1
blah: fred barney
      g++ betty
```

Here's what happens when I use it:

```
% make -f diane1
make: Fatal error in reader: diane1, line 3:
Unexpected end of line seen
```

7

Other pitfalls with make and tabs

If put in a blank before the tab, make will also freak out. Yuk!

But at least now you have some tools for figuring out the problem.

So how can I “see” my tabs?
