Week 1 – Part 2: The Relational Model

The Relational Model Mathematical Relations Attributes and Database Schema Null Values and Database Constraints Keys, Primary and Foreign Keys

The Relational Model

- Proposed by E. F. Codd in 1970 as a data model which strongly supports data independence.
- Made available in commercial DBMSs in 1981 -- it is not easy to implement data independence efficiently and reliably!
- It is based on (a variant of) the mathematical notion of *relation*.
- Relations are represented as tables.

Mathematical Relations

The Relational Model - 1

The Relational Model - 3

- Given sets D₁, D₂, ..., D_n, not necessarily distinct.
- The Cartesian product $D_1xD_2x...xD_n$ is the set of all (ordered) n-tuples $d_1, d_2, ..., dn$ > such that $d_1 \in D_1, d_2 \in D_2, ..., d_n \in D_n$
- A mathematical relation on D₁, D₂, ..., D_n is a subset of the Cartesian product D₁xD₂x...xD_n.
- D₁, D₂, ..., D_n are the *domains* of the relation.
- n is the *degree* of the relation.

cscC43/343 - Introduction to Databases

cscC43/343 - Introduction to Databases

• The number of n-tuples in a given relation is the *cardinality* of that relation; the cardinality of a relation is always finite.

An Example

 $\texttt{Games} \subseteq \texttt{String} \times \texttt{String} \times \texttt{Integer} \times$

| Juve | Lazio | 3 | 1 |
|-------|-------|---|---|
| Lazio | Milan | 2 | 0 |
| Juve | Roma | 1 | 2 |
| Roma | Milan | 0 | 1 |

- Note that String and Integer each play two roles, distinguished by means of position.
- The structure of a relation is positional.

```
cscC43/343 - Introduction to Databases
```

cscC43/343 - Introduction to Databases

1

Attributes

- We would like to have a non-positional structure for relations. To do so, we associate a unique name (attribute) with each domain of a relation which describes the role of the domain.
- In the tabular representation, attributes are used as column headings

| HomeTeam | VisitingTeam | HomeGoals | VisitorGoals |
|----------|--------------|-----------|--------------|
| Juve | Lazio | 3 | 1 |
| Lazio | Milan | 2 | 0 |
| Juve | Roma | 1 | 2 |
| Roma | Milan | 0 | 1 |

cscC43/343 - Introduction to Databases

The Relational Model - 5

Notation

- t[A] (or t.A) denotes the value on A of a tuple t
- In the example, if t is the first tuple in the table t[VisitingTeam] = Lazio
- The same notation is extended to sets of attributes, thus denoting tuples: t[VisitingTeam,VisitorGoals]
- is a tuple on two attributes, <Lazio,1>
- More generally, if X is a sequence of attribute names A₁,...A_n, t[X] is <t[A₁],t[A₂],...t[A_n]>

cscC43/343 - Introduction to Databases

The Relational Model - 6

Value-Based References

| Students | RegNum | Num Surname FirstNam | | me | | BirthDat | е | | | |

cscC43/343 - Introduction to Databases

The Relational Model - 8

cscC43/343 - Introduction to Databases

Advantages of Value-Based References

- Value-based references lead to independence from physical structures, such as pointers.
- Pointers are implemented differently on different hardware, inhibit portability of a database.

Notes:

- Pointers usually exist at the physical level, but they are not visible at the logical level
- Object identifiers in object databases share some features with pointers, at a higher
 Level of abstraction.

Definitions

Relation schema:

A name (of the relation) R with a set of attributes $A_1,..., A_n$: $R(A_1,..., A_n)$ **Database schema:** A set of relation schemas with different names $D = \{R_1(X_1), ..., R_n(X_n)\}$ **Relation** (instance) on a relation schema R(X): Set r of tuples on X **Database** (instance) on a schema $D = \{R_1(X_1), ..., R_n(X_n)\}$: Set of relations $r = \{r_1,..., r_n\}$ (with r_i relation on R_i)

cscC43/343 - Introduction to Databases

The Relational Model - 10

Examples

• Relations on a single attribute are admissible:

| Students | RegNum | Surname | FirstName | BirthDate |
|----------|--------|---------|-----------|------------|
| | 6554 | Rossi | Mario | 5/12/1978 |
| | 8765 | Neri | Paolo | 3/11/1976 |
| | 9283 | Verdi | Luisa | 12/11/1979 |
| | 3456 | Rossi | Maria | 1/2/1978 |

| Workers | RegNum |
|---------|--------|
| | 6554 |
| | 8765 |
| | |

Nested structures

cscC43/343 - Introduction to Databases

The Relational Model - 15

Questions

- Have we represented all details of receipts?
- Well, it depends on what we are really interested in:

What else could we require?

If needed, an alternative organization is possible

Incomplete Information

- The relational model imposes a rigid structure on data:
 - information is represented by means of tuples;
 - tuples must conform to relation schemas.
- In practice, available data need not conform to the required formats. In particular, values of attributes may be missing for a particular tuple we want to add to a relational database.

```
cscC43/343 - Introduction to Databases
```

cscC43/343 - Introduction to Databases

Incomplete information: Motivation

(County towns have government offices, other towns do not.)

- Florence is a county town; so it has a government office, but we do not know its address.
- Tivoli is not a county town; so it has no government office.
- Prato has recently become a county town; has the government office been established? We don't know!

| | City | GovtAddress | |
|--|----------|-----------------|---------------------------|
| | Roma | Via IV novembre | |
| | Florence | ? | |
| | Tivoli | ?? | |
| cscC43/343 – Introduction to Databases | Prato | ??? | The Relational Model — 17 |

Incomplete Information in the Relational Model

- A simple but effective technique is adopted by the Relational Model: use null values.
- A null value is a special value (i.e., not a value of the domain) which denotes the absence of a domain value.
- We could (and often should) put restrictions on the presence of null values in tuples (more on this later.)

Incomplete information: Solutions

We should not use domain values (0, 99, empty string, etc.) to represent lack of information:

- Using unused values may lead to ambiguity and confusion.
- Unused values could become meaningful.
- Within applications, we should be able to distinguish between actual values and placeholders.
- For example, in order to calculate the average age of a set of people, use 50 as default value for unknown ages! cscC43/343 - Introduction to Databases The Relational Model - 18

Types of Null Values

- At least three different types are useful:
 - unknown value : there is a domain value, but it is not known (Florence);
 - non-existent value: the attribute is not applicable for the tuple (Tivoli);
 - no-information value: we don't know whether a value exists or not (Prato); this is the disjunction (logical or) of the other two.
- DBMSs do not distinguish between these types: they implicitly adopt the noinformation value.

| Α | Meaning | less l | Data | hase |

WHAT ARE SOME PROBLEMS WITH THIS DATABASE?

Integrity Constraints

- An integrity constraint is a property that must be satisfied by all meaningful database instances.
- A constraint can be seen as a predicate; a database is *legal* if it satisfies all integrity constraints.
- Types of constraints

cscC43/343 - Introduction to Databases

- Intra-relational constraints, with domain constraints and tuple constraints as special cases;
- Inter-relational constraints.

cscC43/343 - Introduction to Databases

The Relational Model - 21

Rationale for Integrity Constraints

- Useful for describing the application in greater detail.
- Contribute to *data quality*.
- An element in the design process; we will discuss later normal forms.
- Used by the system in choosing a strategy for query processing
- Note: It is not the case that all desirable properties of the data in a database can be described by means of integrity constraints!
 - e.g., "data in the relation **Employee** must be valid"

cscC43/343 - Introduction to Databases

The Relational Model - 23

Tuple and Domain Constraints

- A tuple constraint expresses conditions on the values of each tuple, independently of other tuples.
- For example. (NOT (Honours ='honours'))OR(Grade = 'A')
- Another example (derivation rule) Net = Amount-Deductions
- A *domain constraint* is a tuple constraint that involves a single attribute

e.g., (Grade \leq 'A') AND (Grade \geq 'F')

Unique Identification for Tuples

| RegNum | Surname | FirstName | BirthDate | DegreeProg |
|--------|---------|-----------|-----------|-------------|
| 284328 | Smith | Luigi | 29/04/59 | Computing |
| 296328 | Smith | John | 29/04/59 | Computing |
| 587614 | Smith | Lucy | 01/05/61 | Engineering |
| 934856 | Black | Lucy | 01/05/61 | Fine Art |
| 965536 | Black | Lucy | 05/03/58 | Fine Art |

- Registration number identifies students, i.e., there is no pair of tuples with the same value for **RegNum**.
- Personal data could identify students as well, i.e., there is no pair of tuples with the same values for all of **Surname**,

FirstName, BirthDate.

cscC43/343 - Introduction to Databases

cscC43/343 - Introduction to Databases

An Example

| RegNum | Surname | FirstName | BirthDate | DegreeProg |
|--------|---------|-----------|-----------|-------------|
| 284328 | Smith | Luigi | 29/04/59 | Computing |
| 296328 | Smith | John | 29/04/59 | Computing |
| 587614 | Smith | Lucy | 01/05/61 | Engineering |
| 934856 | Black | Lucy | 01/05/61 | Fine Art |
| 965536 | Black | Lucy | 05/03/58 | Fine Art |

- **RegNum** is a key: i.e., **RegNum** is a superkey and it contains a sole attribute, so it is minimal.
- Surname, Firstname, BirthDate is another key: the three attributes form a superkey and there is no proper subset that is also a superkey.

The Relational Model - 27

The Relational Model - 25

Keys

- A *key* is a set of attributes that uniquely identifies tuples in a relation.
- More precisely:
 - A set of attributes K is a superkey for a relation r if r can not contain two distinct tuples t₁ and t₂ such that t₁[K]=t₂[K];
 - K is a key for r if K is a minimal superkey (that is, there exists no other superkey K' of r that is contained in K as proper subset.)

```
cscC43/343 - Introduction to Databases
```

The Relational Model - 26

Beware!

| RegNum | Surname | FirstName | BirthDate | DegreeProg |
|--------|---------|-----------|-----------|-------------|
| 296328 | Smith | John | 29/04/59 | Computing |
| 587614 | Smith | Lucy | 01/05/61 | Engineering |
| 934856 | Black | Lucy | 01/05/61 | Fine Art |
| 965536 | Black | Lucy | 05/03/58 | Engineering |

 There is no pair of tuples with the same values on both Surname and DegreeProg;

i.e., in each programme students have different surnames; can we conclude that **Surname** and **DegreeProg** form a key for this relation?

• No! There *could be* students with the same surname in the same programme34

```
cscC43/343 - Introduction to Databases
```

Existence of Keys

- Relations are sets; therefore each relation is composed of <u>distinct</u> tuples.
- It follows that the whole set of attributes for a relation defines a **superkey**.
- Therefore each relation has a key, which is the set of all its attributes, or a subset thereof.
- The existence of keys guarantees that <u>each</u> piece of data in the database can be accessed,
- Keys are a major feature of the Relational Model and allow us to say that it is "valuebased".

```
cscC43/343 – Introduction to Databases
```

The Relational Model - 29

Keys and Null Values

- If there are nulls, keys do not work that well:
 - They do not guarantee unique identification;
 - They do not help in establishing correspondences between data in different relations

| RegNum | Surname | FirstName | BirthDate | DegreeProg |
|--------|---------|-----------|-----------|-------------|
| NULL | Smith | John | NULL | Computing |
| 587614 | Smith | Lucy | 01/05/61 | Engineering |
| 934856 | Black | Lucy | NULL | NULL |
| NULL | Black | Lucy | 05/03/58 | Engineering |

- Are the third and fourth tuple the same?
- How do we access the first tuple?

Primary Keys

- The presence of nulls in keys has to be limited.
- Each relation must have a *primary key* on which nulls are not allowed,
- Notation: the attributes of the primary key are <u>underlined.</u>
- References between relations are realized through primary keys,

| | <u>RegNum</u> | Surname | FirstName | BirthDate | DegreeProg |
|-------|-------------------------|-------------|-----------|-----------|---------------------|
| | 643976 | Smith | John | NULL | Computing |
| | 587614 | Smith | Lucy | 01/05/61 | Engineering |
| | 934856 | Black | Lucy | NULL | NULL |
| | 735591 | Black | Lucy | 05/03/58 | Engineering |
| cscC4 | 3/343 – Introduction to | o Databases | | | The Relational Mode |

Do we Always Have Primary Keys?

- In most cases we do have reasonable primary keys.
- In other cases we don't, so we need to introduced new attributes by identifying codes.
- Note that most of the "obvious" codes we have now (social security number, student number, area code, ...) were introduced before the adoption of databases with the same goal in mind, i.e. to offer an unambiguous identification of things.

cscC43/343 - Introduction to Databases

Referential Constraints (Foreign Keys)

- Pieces of data in different relations are correlated by means of values of (primary) keys.
- Referential integrity constraints are imposed in order to guarantee that the values refer to existing tuples in the referenced relation.
- For example, if the manager of the employee with employee# 76544 is an employee with employee# 87233, there better be an employee with such an employee number.

• Also called inclusion dependencies.

cscC43/343 - Introduction to Databases

Example of Referential Constraints

| Offend | es | <u>Code</u> | | Date | Officer | Dep | ot | Re | gistrati | on |
|--------|----|------------------|---|------------|-----------|-----------------|------|---------|----------|----|

| | 6 | 6544 XY | | 47 | Mimau | Mimault Bernard | | d | | |
| | | | | | | | | | | |

Referential Constraints

- A referential constraint requires that the values on a set X of attributes of a relation R_1 must appear as values for the primary key of another relation R_2 .
- In such a situation, we say that X is a foreign key of relation R_1 .
- In the previous example, we have referential constraints between the attribute of the relation Offences and the relation Officers; also between the attributes

Offences and the relation **Cars**.

The Relational Model - 35

The Relational Model - 33

cscC43/343 - Introduction to Databases

Referential Constraints: Comments

- Referential constraints play an important role in making the relational model value-based.
- It is possible to have **features** that support the management of referential constraints ("actions" activated by violations).
- Care is needed in case of referential constraints that involve two or more attributes.

cscC43/343 - Introduction to Databases

The Relational Model - 37
