Week 10: Database Design

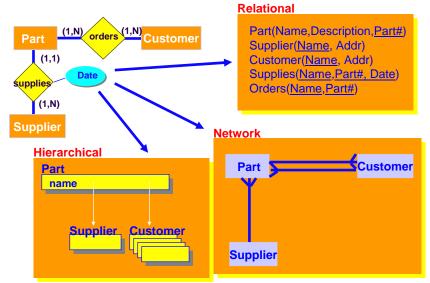

Database Design
From an ER Schema to a Relational One
Restructuring an ER schema
Performance Analysis
Analysis of Redundancies, Removing
Generalizations
Translation into a Relational Schema

CSC343 - Introduction to Databases

Database Design — 1

Designing a Database Schema

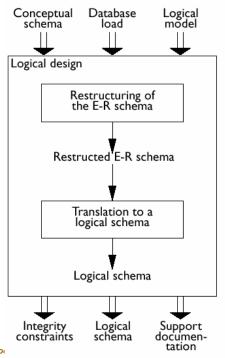

CSC343 - Introduction to Databases

(Relational) Database Design

- Given a conceptual schema (ER, but could also be a UML), generate a logical (relational) schema.
- This is **not** just a simple translation from one model to another for two main reasons:
 - not all the constructs of the Entity-Relationship model can be translated naturally into the relational model;
 - the schema must be restructured in such a way as to make the execution of the projected operations as efficient as possible.
- The topic is covered in section 3.5 of the textbook. This lecture unit uses material from other textbooks as well.

CSC343 - Introduction to Databases

Database Design — 3

Database Design Process

Logical Design Steps

- It is helpful to divide the design into two steps:
- Restructuring of the Entity-Relationship schema, based on criteria for the optimization of the schema and the simplification of the following step;
- 2. Translation into the logical model, based on the features of the logical model (in our case, the relational model).

CSC343 - Introduction to Databases

Database Design — 5

Performance Analysis

- ■An ER schema is restructured to optimize:
 - ✓ Cost of an operation (evaluated in terms of the number of occurrences of entities and relationships that are visited during the execution of an operation);
 - ✓ Storage requirements (evaluated in terms of number of bytes necessary to store the data described by the schema).
- In order to study these parameters, we need to know:
 - ✓Projected volume of data;
 - ✓ Projected operation characteristics.

CSC343 – Introduction to Databases

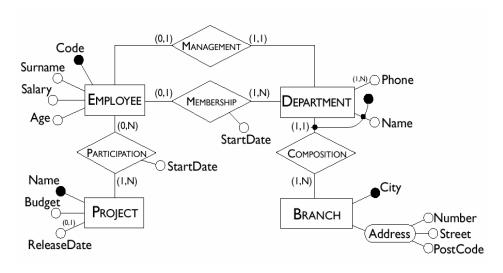

Cost Model

- The cost of an operation is measured in terms of the number of disk accesses required. A disk access is, generally, orders of magnitude more expensive than in-memory accesses, or CPU operations.
- For a coarse estimate of cost, we assume that
 - √a Read operation (for one entity or relationship) requires 1 disk access;
 - A Write operation (for one entity or relationship) requires 2 disk accesses (read from disk, change, write back to disk).

CSC343 - Introduction to Databases

Database Design — 7

Employee-Department Example

CSC343 - Introduction to Databases

Typical Operations

- Operation 1: Assign an employee to a project.
- Operation 2: Find an employee record, including her department, and the projects she works for.
- Operation 3: Find records of employees for a department.
- Operation 4: For each branch, retrieve its departments, and for each department, retrieve the last names of their managers, and the list of their employees.
- Note: For UML class diagrams, these would be operations associated with persistent database classes.

CSC343 - Introduction to Databases

Database Design — 9

Tables of Volumes and Operations

The volume of data and the general characteristics of the operations can be summed up using two special tables.

Table of volumes

14810 01 101411100			
Concept	Туре	Volume	
Branch	Е	10	
Department	E	80	
Employee	E	2000	
Project	E	500	
Composition	R	80	
Membership	R	1900	
Management	R	80	
Participation	R	6000	

Table of operations

Operation	Type	Frequency		
Operation 1	ı	50 per day		
Operation 2	I	100 per day		
Operation 3	I	10 per day		
Operation 4	В	2 per day		

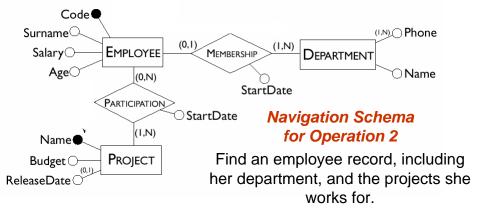

I - Interactive

B - Batch

CSC343 - Introduction to Databases

Navigation Schema

A *navigation schema* starts from the inputs to an operation and moves (via arrows) towards its outputs.

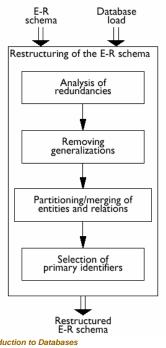

CSC343 - Introduction to Databases

Database Design — 11

Table of Accesses

This table evaluates the cost of an operation, using the table of volumes and the navigation schema.

		Operation 2	2	
	Concept	Туре	Accesses	Type
	Employee	Entity	1	R
	Membership	Relationship	1	R
	Department	Entity	1	R
	Participation	Relationship	(3)	R
	Project	Entity	3/	R
Average # participati projects p	ions and per emplo	oyee	W -	oe: - Rea - Writ / - Re

Analysis Steps

CSC343 - Introduction to Databases

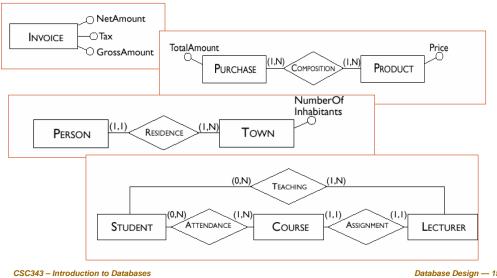

Database Design — 13

Analysis of Redundancies

- A redundancy in a conceptual schema corresponds to a piece of information that can be derived (that is, obtained through series of retrieval a operations) from other data in the database.
- An Entity-Relationship schema may contain various forms of redundancy.

CSC343 - Introduction to Databases

Examples of Redundancies

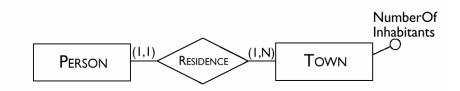

Database Design — 15

Deciding About Redundancies

- The presence of a redundancy in a database may be
 - √ an advantage: a reduction in the number of accesses necessary to obtain the derived information;
 - disadvantage because of larger requirements, (but, usually at negligible cost) and the necessity to carry out additional operations in order to keep the derived data consistent.
- The decision to maintain or eliminate a redundancy is made by comparing the cost of operations that involve the redundant information and the storage needed, in the case of presence or absence of redundancy.

CSC343 - Introduction to Databases

Cost Comparison: An Example

In this schema the attribute NumberOfInhabitants is redundant.

CSC343 - Introduction to Databases

Database Design — 17

Load and Frequency of Operations

Table of volumes

Concept	Type	Volume
Town	Е	200
Person	E	1000000
Residence	R	1000000

Table of operations

Operation	Type	Frequency
Operation 1	I	500 per day
Operation 2	I	2 per day

- Operation 1: add a new person with the person's town of residence.
- Operation 2: print all the data of a town (including the number of inhabitants).

CSC343 - Introduction to Databases

Table of Accesses, with Redundancy

Operation 1

Concept	Type	Accesses	Type
Person	Entity	1	W
Residence	Relationship	1	W
Town	Entity	1	W

Operation 2

Concept	Type	Accesses	Type
Town	Entity	1	R

CSC343 - Introduction to Databases

Database Design — 19

Table of Accesses, without Redundancy

Operation 1

Concept	Type	Accesses	Type
Person	Entity	1	W
Residence	Relationship	1	W

Operation 2

Concept	Туре	Accesses	Type
Town	Entity	1	R
Residence	Relationship	5000	R

CSC343 - Introduction to Databases

Comparing the Cost of Operations

- Presence of redundancy:
 - ✓Operation 1: 1,500 write accesses per day;
 - √The cost of operation 2 is almost negligible;
 - ✓ Counting twice the write accesses, we have a total of 3,000 accesses a day.
- Absence of redundancy.
 - ✓Operation 1: 1,000 write accesses per day;
 - ✓Operation 2 however requires a total of 10,000 read accesses per day;
 - ✓ Counting twice the write accesses, we have a total of 12,000 accesses per day.

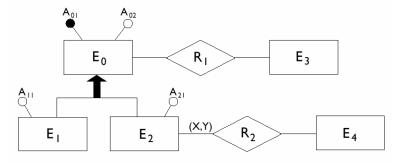

Redundant data may improve performance!

CSC343 - Introduction to Databases

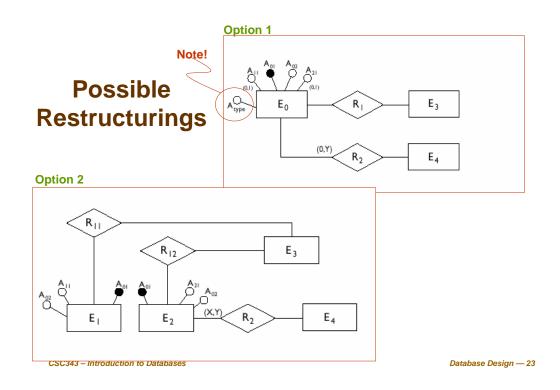

Database Design — 21

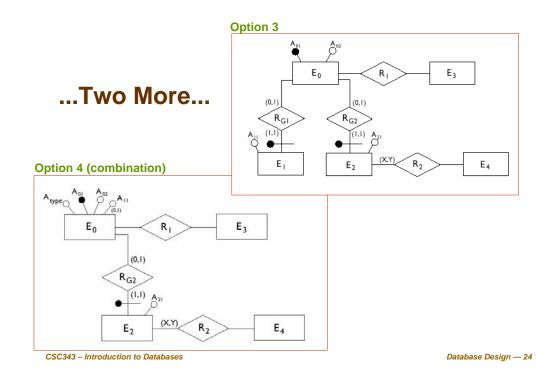

Removing Generalizations

- ■The relational model does not allow direct representation of generalizations that may be present in an E-R diagram.
- For example, here is an ER schema with generalizations:

CSC343 - Introduction to Databases

General Rules For Removing Generalization

- Option 1 is convenient when the operations involve the occurrences and the attributes of E_0 , E_1 and E_2 more or less in the same way.
- Option 2 is possible only if the generalization satisfies the coverage constraint (i.e., every instance of E_0 is either an instance of E_1 or E_2) and is useful when there are operations that apply only to occurrences of E_1 or E_2 .
- Option 3 is useful when the generalization is not coverage-compliant and the operations refer to either occurrences and attributes of E_1 (E_2) or of E_0 , and therefore make distinctions between child and parent entities.
- Available options can be combined (see option 4)

 CSC343 Introduction to Databases

 CSC343 Introduction to Databases

 Database Design 25

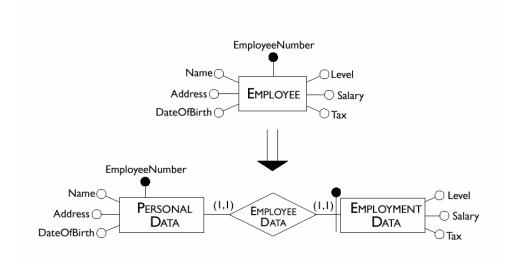

Partitioning and Merging of Entities and Relationships

Entities and relationships of an E-R schema can be partitioned or merged to improve the efficiency of operations, using the following principle:

Accesses are reduced by separating attributes of the same concept that are accessed by different operations and by merging attributes of different concepts that are accessed by the same operations.

CSC343 - Introduction to Databases

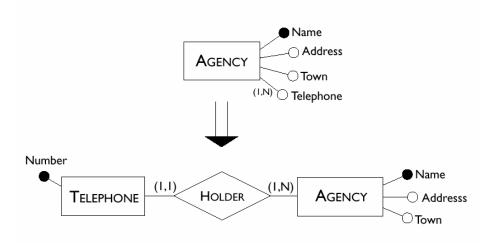

Example of Partitioning

CSC343 - Introduction to Databases

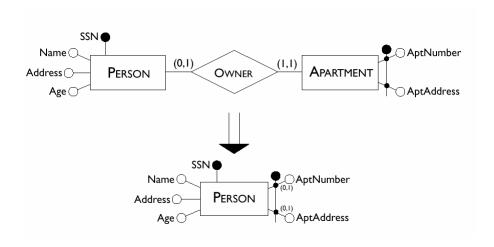

Database Design — 27

Deletion of Multi-Valued Attribute

CSC343 - Introduction to Databases

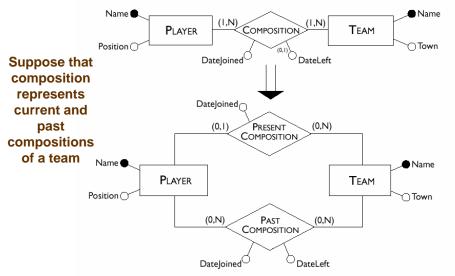

Merging Entities

CSC343 - Introduction to Databases

Database Design — 29

Partitioning of a Relationship

CSC343 – Introduction to Databases

Selecting a Primary Key

- Every relation must have a unique primary key.
- The criteria for this decision are as follows:
 - ✓ Attributes with null values cannot form primary keys;
 - ✓ One/few attributes is preferable to many attributes;
 - ✓Internal key preferable to external ones (weak entity);
 - ✓ A key that is used by many operations to access the instances of an entity is preferable to others.
- At this stage, if none of the candidate keys satisfies the above requirements, it may be best to introduce a new attribute (e.g., social insurance #, student #,...)

CSC343 - Introduction to Databases

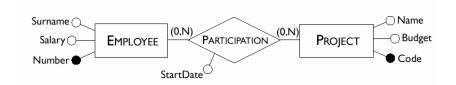

Database Design — 31

Translation into a Logical Schema

- The second step of logical design consists of a translation between different data models.
- ■Starting from an E-R schema, an equivalent relational schema is constructed. By "equivalent", we mean a schema capable of representing the same information.
- ■We will deal with the translation problem systematically, beginning with the fundamental case, that of entities linked by many-to-many relationships.

CSC343 – Introduction to Databases

Many-to-Many Relationships

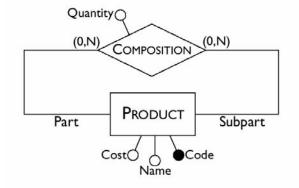

Employee(<u>Number</u>, Surname, Salary)
Project(<u>Code</u>, Name, Budget)
Participation(<u>Number</u>, <u>Code</u>, StartDate)

CSC343 - Introduction to Databases

Database Design — 33

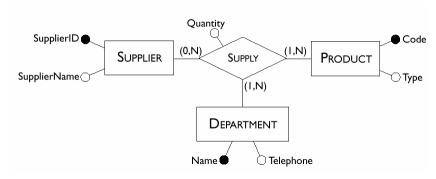

Many-to-Many Recursive Relationships

Product(<u>Code</u>, Name, Cost) Composition(<u>Part</u>, <u>SubPart</u>, Quantity)

CSC343 - Introduction to Databases

Ternary Relationships

Supplier(SupplierID, SupplierName)
Product(Code, Type)
Department(Name, Telephone)
Supply(Supplier, Product, Department,
Quantity)

Database Design — 35

One-to-Many Relationships

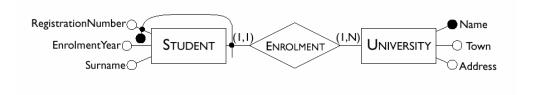

Player(<u>Surname</u>, <u>DateOfBirth</u>, Position)
Team(<u>Name</u>, Town, TeamColours)
Contract(<u>PlayerSurname</u>, <u>PlayerDateOfBirth</u>, Team,
Salary)

OR

Player(<u>Surname</u>, <u>DateOfBirth</u>, Position, TeamName, Salary)
Team(<u>Name</u>, Town, TeamColours)

CSC343 - Introduction to Databases

Weak Entities

Student(<u>RegistrationNumber</u>, <u>University</u>, Surname, EnrolmentYear) University(<u>Name</u>, Town, Address)

CSC343 - Introduction to Databases

Database Design — 37

One-to-One Relationships

Head(<u>Number</u>, Name, Salary, Department, StartDate)

Department (Name, Telephone, Branch)

Head(<u>Number</u>, Name, Salary, StartDate)
Department(<u>Name</u>, Telephone, HeadNumber,
Branch)

CSC343 - Introduction to Databases

Optional One-to-One Relationships

Employee(Number, Name, Salary) Department(Name, Telephone, Branch, Head, StartDate)

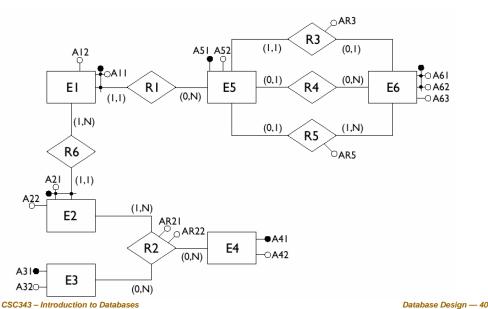

Or, if both entities are optional

Employee(Number, Name, Salary) Department(Name, Telephone, Branch) Management (Head, Department, StartDate)

The Training Company Revisited

CSC343 – Introduction to Databases

Operational Requirements, Revisited

- operation 1: insert a new trainee including all his or her data (to be carried out approximately 40 times a day);
- operation 2: assign a trainee to an edition of a course (50 times a day);
- operation 3: insert a new instructor, including all his or her data and the courses he or she is qualified to teach (twice a day);
- operation 4: assign a qualified instructor to an edition of a course (15 times a day);
- operation 5: display all the information on the past editions of a course with title, class timetables and number of trainees (10 times a day):
- operation 6: display all the courses offered, with information on the instructors who are qualified to teach them (20 times a day);
- operation 7: for each instructor, find the trainees all the courses he or she is teaching or has taught (5 times a week);
- operation 8: carry out a statistical analysis of all the trainees with all the information about them, about the editions of courses they have attended and the marks obtained (10 times a month).

Composition	R	8000
Туре	R	1000
PastTeaching	R	900
CurrentTeaching	R	100
Qualification	R	500
CurrentEmployment	R	4000
PastEmployment	R	10000

Table of operations

Operation	Type	Frequency
Operation 1		40 per day
Operation 2	I	50 per day
Operation 3	I	2 per day
Operation 4	I	15 per day
Operation 5	I	10 per day
Operation 6	I	20 per day
Operation 7	I	5 per day
Operation 8	В	10 per month

CSC343 - Introduction to Databases

Access Tables

The attribute NumberOfParticipants in CourseEdition can be derived from relationships CurrentAttendance, PastAttendance.

Operation 2 with redundancy

Concept	Type	Acc	Type
Trainee	Е	1	R
CurrentAtt'nce	R	1	W
CourseEdition	Е	1	R
CourseEdition	Е	1	W

Operation 5 with redundancy

Concept	Туре	Acc	Туре
CourseEdition	Е	5	R
Type	R	5	R
Course	E	1	R
Composition	R	40	R
Class	Е	40	R

Operation 2 without redundancy

Concept	Type	Acc	Type
Trainee	Е	1	R
CurrentAtt'nce	R	1	W

Operation 5 without redundancy

Concept	Туре	Acc	Туре
CourseEdition	Е	5	R
Type	R	5	R
Course	Е	1	R
Composition	R	40	R
Class	Е	40	R
PastAtt'nce	Е	50	R

CSC343 - Introduction to Databases

Database Design — 53

Analysis of Redundancy

- From the access tables we obtain (giving double weight to the write accesses):
 - ✓ presence of redundancy: for operation 2 we have 100 read disk accesses and 200 write disk accesses per day; for operation 5 we have 910 read accesses per day, for a total of 1,210 disk accesses per day;
 - ✓ without redundancy: for operation 2 we have 50 read accesses per day and 100 write accesses per day; for operation 5, we have 1,410 read accesses per day, for a total of 1,560 accesses per day.
- Thus, redundancy makes sense in this case, so we leave NumberOfParticipants as an attribute of the entity CourseEdition.

CSC343 - Introduction to Databases

Removing Generalizations

- For the generalization on instructors:
 - ✓ the relevant operations make no distinction between the child entities and these entities have no specific attributes;
 - ✓ we can therefore delete the child entities and add an attribute Type to the parent entity.
- For the generalization on trainees:
 - ✓ the relevant operations make no distinction between the child entities, but these entities have specific attributes;
 - we can therefore leave all the entities and add two relationships to link each child with the parent entity: in this way, we will have no attributes with possible null values on the parent entity and the dimension of the relations will be reduced.

CSC343 - Introduction to Databases

Database Design — 55

Partitioning and Merging of Concepts

- ■The relationships *PastTeaching* and *PresentTeaching* can be merged since they describe similar concepts between which the operations make no difference. A similar consideration applies to the relationships *PastAttendance* and *PresentAttendance*.
- The multi-valued attribute *Telephone* can be removed from the *Instructor* entity by introducing a new entity *Telephone* linked by a one-to-many relationship to the *Instructor* entity.

CSC343 - Introduction to Databases

Choice of Main Identifiers

■ *Trainee* entity:

- √ there are two identifiers: the social security number and the internal code;
- ✓it is far preferable to choose the latter: a social security number will require several bytes whereas an internal code, which serves to distinguish between 5000 occurrences, requires a few bytes.

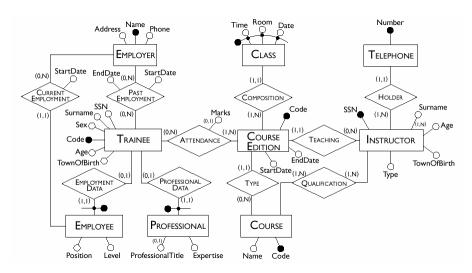

■ *CourseEdition* entity:

- √it is identified externally by the StartDate
 attribute and by the Course entity;
- we can see however that we can easily generate for each edition a code from the course code: this code is simpler and can replace the external identifier.

CSC343 - Introduction to Databases

Database Design — 57

After Restructuring

CSC343 - Introduction to Databases

Translation into the Relational Model

CourseEdition(Code, StartDate, EndDate, Course, Instructor)

Class(Time, Room, Date, Edition)

Instructor(SSN, Surname, Age, TownOfBirth, Type)

Telephone (Number, Instructor)

Course(Code, Name)

Qualification(Course, Instructor)

Trainee(Code, SSN, Surname, Age, TownOfBirth, Sex)

Attendance(Trainee, Edition, Marks*)

Employer(Name, Address, Telephone)

PastEmployment (<u>Trainee</u>, <u>Employer</u>, StartDate, EndDate)

Professional(<u>Trainee</u>, Expertise, ProfessionalTitle*)
Employee(<u>Trainee</u>, Level, Position, Employer, StartDate)

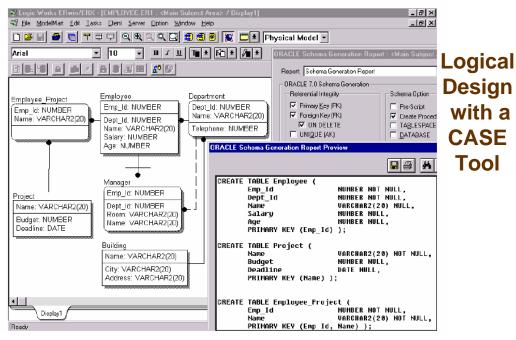

CSC343 - Introduction to Databases

Database Design — 59

Logical Design Using CASE Tools

- The logical design phase is partially supported by database design tools:
 - √ the translation to the relational model is carried out by such tools semi-automatically;
 - √ the restructuring step is difficult to automate and CASE tools provide little or no support for it.
- Most commercial CASE tools will generate automatically SQL code for the creation of the database.
- Some tools allow direct connection with a DBMS and can construct the corresponding database automatically.
- [CASE = Computer-Aided Software Engineering]
