

# Object Detection

# Object Detection

- The goal of object detection is to localize objects in an image and tell their class
- Localization: **place a tight bounding box around object**
- Most approaches find only objects of one or a few specific classes, e.g. car or cow

# Type of Approaches

Different approaches tackle detection differently. They can roughly be categorized into three main types:

- Find **interest points**, followed by Hough voting

# Interest Point Based Approaches

- Compute interest points (e.g., Harris corner detector is a popular choice)
- Vote for where the object could be given the content around interest points

**Interest points**

# Interest Point Based Approaches

- Compute interest points (e.g., Harris corner detector is a popular choice)
- Vote for where the object could be given the content around interest points

Interest points

# Interest Point Based Approaches

# Type of Approaches

Different approaches tackle detection differently. They can roughly be categorized into three main types:

- Find **interest points**, followed by Hough voting
- **Sliding windows**: “slide” a box around image and classify each image crop inside a box (contains object or not?)
- Generate **region (object) proposals**, and classify each region

# Region Proposal Based Approaches

- Group pixels into object-like regions

# Region Proposal Based Approaches

- Group pixels into object-like regions

# Region Proposal Based Approaches

- Group pixels into object-like regions

# Region Proposal Based Approaches

- Generate **many** different regions

# Region Proposal Based Approaches

- Generate **many** different regions

# Region Proposal Based Approaches

- Generate **many** different regions

# Region Proposal Based Approaches

- The hope is that at least a few will cover real objects

# Region Proposal Based Approaches

- The hope is that at least a few will cover real objects

# Region Proposal Based Approaches

- Select a region

# Region Proposal Based Approaches

- Crop out an image patch around it, throw to classifier (e.g., Neural Net)

classifier  
"dog" or not?

confidence: -2.5

# Region Proposal Based Approaches

- Do this for every region

# Region Proposal Based Approaches

- Do this for every region

# Region Proposal Based Approaches

- Do this for every region

classifier  
"dog" or not?

confidence: 1.5

**Dog!!!**

# Type of Approaches

Different approaches tackle detection differently. They can roughly be categorized into three main types:

- Find **interest points**, followed by Hough voting ← **Let's first look at one example method for this**
- **Sliding windows**: “slide” a box around image and classify each image crop inside a box (contains object or not?)
- Generate **region (object) proposals**, and classify each region

# Object Detection via Hough Voting: Implicit Shape Model

B. Leibe, A. Leonardis, B. Schiele

*Robust Object Detection with Interleaved Categorization and  
Segmentation*

IJCV, 2008

Paper: <http://www.vision.rwth-aachen.de/publications/pdf/leibe-interleaved-ijcv07final.pdf>

# Start with Simple: Line Detection

- How can I find lines in this image?

[Source: K. Grauman]

# Hough Transform

- Idea: Voting (Hough Transform)
- Voting is a general technique where we let the features vote for all models that are compatible with it.
  - Cycle through features, cast votes for model parameters.
  - Look for model parameters that receive a lot of votes.

[Source: K. Grauman]

# Hough Transform: Line Detection

- Hough space: parameter space

- Connection between image  $(x, y)$  and Hough  $(m, b)$  spaces
  - A line in the image corresponds to a point in Hough space
  - What does a point  $(x_0, y_0)$  in the image space map to in Hough space?

[Source: S. Seitz]

# Hough Transform: Line Detection

- Hough space: parameter space

- Connection between image  $(x, y)$  and Hough  $(m, b)$  spaces
  - A line in the image corresponds to a point in Hough space
  - A point in image space votes for all the lines that go through this point. This votes are a line in the Hough space.

[Source: S. Seitz]

# Hough Transform: Line Detection

- Hough space: parameter space

- Two points: Each point corresponds to a line in the Hough space
- A point where these two lines meet defines a line in the image!

[Source: S. Seitz]

# Hough Transform: Line Detection

- Hough space: parameter space

image space

Hough (parameter) space

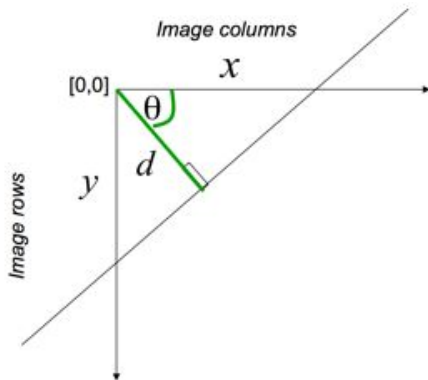

- Vote with each image point
- Find peaks in Hough space. Each peak is a line in the image.

[Source: S. Seitz]

# Hough Transform: Line Detection

- Issues with usual  $(m, b)$  parameter space: undefined for vertical lines
- A better representation is a polar representation of lines

$d$ : perpendicular distance from line to origin

$\theta$ : angle the perpendicular makes with the x-axis

$$x \cos \theta - y \sin \theta = d$$

Point in image space  $\rightarrow$  sinusoid segment in Hough space

[Source: S. Seitz]

# Example Hough Transform

With the parameterization  $x \cos \theta + y \sin \theta = d$

- Points in picture represent sinusoids in parameter space
- Points in parameter space represent lines in picture
- Example  $0.6x + 0.4y = 2.4$ , Sinusoids intersect at  $d = 2.4$ ,  $\theta = 0.9273$

[Source: M. Kazhdan, slide credit: R. Urtasun]

# Hough Transform: Line Detection

- Hough Voting algorithm

Using the polar parameterization:

$$x \cos \theta - y \sin \theta = d$$

Basic Hough transform algorithm

1. Initialize  $H[d, \theta] = 0$
2. for each edge point  $I[x, y]$  in the image  
for  $\theta = [\theta_{\min} \text{ to } \theta_{\max}]$  // some quantization  
 $d = x \cos \theta - y \sin \theta$   
 $H[d, \theta] += 1$
3. Find the value(s) of  $(d, \theta)$  where  $H[d, \theta]$  is maximum
4. The detected line in the image is given by  $d = x \cos \theta - y \sin \theta$

[Source: S. Seitz]

# Hough Transform: Circle Detection

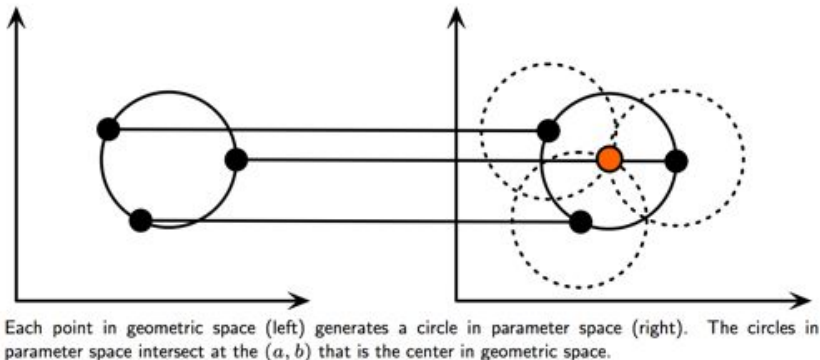

- What about circles? How can I fit circles around these coins?

# Hough Transform: Circle Detection

Assume we are looking for a circle of known radius  $r$

- Circle:  $(x - a)^2 + (y - b)^2 = r^2$
- Hough space  $(a, b)$ : A point  $(x_0, y_0)$  maps to  $(a - x_0)^2 + (b - y_0)^2 = r^2 \rightarrow$  a circle around  $(x_0, y_0)$  with radius  $r$
- Each image point votes for a circle in Hough space

[Source: H. Rhody]

# Hough Transform: Circle Detection

What if we don't know  $r$ ?

- Hough space: ?

[Source: K. Grauman]

# Hough Transform: Circle Detection

What if we don't know  $r$ ?

- Hough space: conics

[Source: K. Grauman]

# Hough Transform: Circle Detection

- Find the coins

[Source: K. Grauman]

# Hough Transform: Circle Detection

- Iris detection

[Source: K. Grauman]

# Generalized Hough Voting

- Hough Voting for general shapes

## Offline procedure:

At each boundary point, compute displacement vector:  $\mathbf{r} = \mathbf{a} - \mathbf{p}_i$ .

Store these vectors in a table indexed by gradient orientation  $\theta$ .

# Implicit Shape Model

- Implicit Shape Model adopts the idea of voting
- Basic idea:
  - Find interest points in an image
  - Match patch around each interest point to a training patch
  - Vote for object center given that training instance

# Implicit Shape Model: Basic Idea

- Vote for object center

**vote** for center of object

# Implicit Shape Model: Basic Idea

- Vote for object center

# Implicit Shape Model: Basic Idea

- Vote for object center

**vote** for center of object

# Implicit Shape Model: Basic Idea

- Vote for object center

of course some wrong votes are bound to happen...

# Implicit Shape Model: Basic Idea

- Vote for object center

But that's ok. We want only **peaks** in voting space.

# Implicit Shape Model: Basic Idea

- Find the patches that produced the peak

Find patches that voted for the peaks (back-projection).

# Implicit Shape Model: Basic Idea

- Place a box around these patches → objects!

Find full objects based on the back-projected patches.

# Implicit Shape Model: Basic Idea

- Really easy. Only one problem... Would be slow... How do we make it fast?

we need to match a patch around each yellow + to all patches in all training images → **SLOW**

# Implicit Shape Model: Basic Idea

- **Visual vocabulary** (we saw this for retrieval)
- Compare each patch to a small set of visual words (clusters)

**Visual words (visual codebook)!**

# Implicit Shape Model: Basic Idea

- Training: Getting the vocabulary

training image

# Implicit Shape Model: Basic Idea

- Find interest points in each training image

training image

detect interest points (e.g. Harris)

# Implicit Shape Model: Basic Idea

- Collect patches around each interest point

training image

extract an image patch around each interest point

# Implicit Shape Model: Basic Idea

- Collect patches across all training examples

training images

collect all patches

# Implicit Shape Model: Basic Idea

- Cluster the patches to get a small set of “representative” patches

training images

collect all patches

visual codebook

- cluster the patches to get a few “representative” patches
- each cluster represented as the average of all patches that belong to the cluster

clusters

# Implicit Shape Model: Training

- Represent each training patch with the closest visual word.
- Record the displacement vectors for each word across all training examples.

Training image

Visual codeword with displacement vectors

[Leibe et al. IJCV 2008]

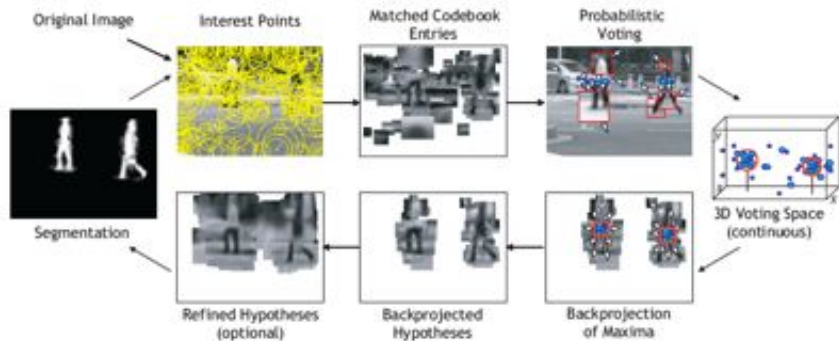

# Implicit Shape Model: Test

- At test times detect interest points
- Assign each patch around interest point to closes visual word
- Vote with all displacement vectors for that word

[Source: B. Leibe]

# Recognition Pipeline

[Source: B. Leibe]

# Recognition Summary

- Apply interest points and extract features around selected locations.
- Match those to the codebook.
- Collect consistent configurations using Generalized Hough Transform.
- Each entry votes for a set of possible positions and scales in continuous space.
- Extract maxima in the continuous space using Mean Shift.
- Refinement can be done by sampling more local features.

# Scale Invariant Voting

## Scale-invariant feature selection

- Scale-invariant interest points
- Rescale extracted patches
- Match to constant-size codebook

## Generate scale votes

- Scale as 3rd dimension in voting space

$$x_{vote} = x_{img} - x_{occ}(s_{img}/s_{occ})$$

$$y_{vote} = y_{img} - y_{occ}(s_{img}/s_{occ})$$

$$s_{vote} = s_{img}/s_{occ}$$

- Search for maxima in 3D voting space

[Source: B. Leibe, credit: R. Urtasun]

# Scale Invariant Voting

# Scale Voting: Efficient Computation

## Continuous Generalized Hough Transform

- Binned accumulator array similar to standard Gen. Hough Transf.
- Quickly identify candidate maxima locations
- Refine locations by Mean-Shift search only around those points
- Avoid quantization effects by keeping exact vote locations.

Scale votes

# Extension: Rotation-Invariant Detection

- Polar instead of Cartesian voting scheme
- Recognize objects under image-plane rotations
- Possibility to share parts between articulations
- But also increases false positive detections

[Source: B. Leibe, credit: R. Urtasun]

# Sometimes it's Necessary

Figure from [Mikolajczyk et al., CVPR'06]

B. Leibe

[Source: B. Leibe]

# Inferring Other Information: Part Labels

[Source: B. Leibe]

# Inferring Other Information: Depth

*“Depth from a single image”*

[Source: B. Leibe]

# Conclusion

- Exploits a lot of parts (as many as interest points)
- Very simple Voting scheme: Generalized Hough Transform
- Works well, but not as well as Deformable Part-based Models with latent SVM training (next time)
- Extensions: train the weights discriminatively.
- Code, datasets & several pre-trained detectors available at <http://www.vision.ee.ethz.ch/bleibe/code>
