

Cameras and Images

Pinhole Camera

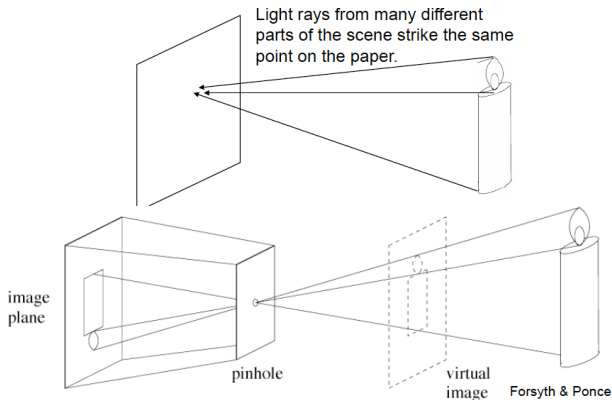

[Source: A. Torralba]

- Make your own camera
- http://www.foundphotography.com/PhotoThoughts/archives/2005/04/pinhole_camera_2.html

Pinhole Camera – How It Works

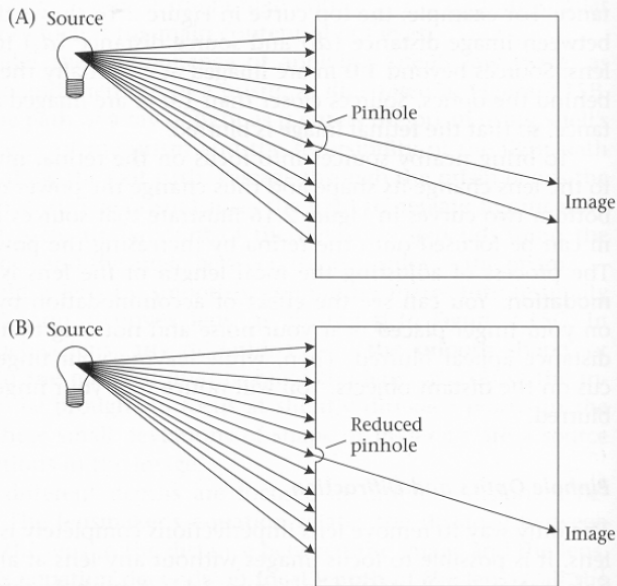

[Source: A. Torralba]

- The pinhole camera only allows rays from one point in the scene to strike each point of the paper.

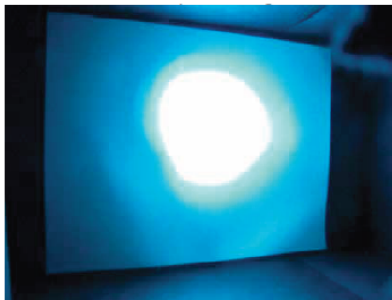

Pinhole Camera – How It Works

source: A. Torralba]

Pinhole Camera – Example

[Source: A. Torralba]

Pinhole Camera

[Source: A. Torralba]

- You can make it stereo

Pinhole Camera – Stereo Example

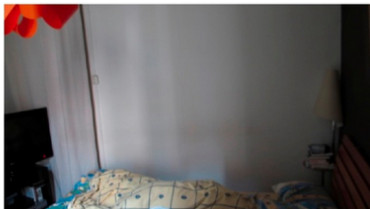

[Source: A. Torralba]

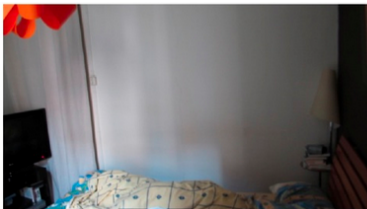

- Try it with 3D glasses!

Pinhole Camera

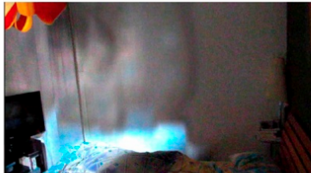

[Source: A. Torralba]

a) Input (occluder present)

b) Reference (occluder absent)

c) Difference image (b-a)

d) Crop upside down

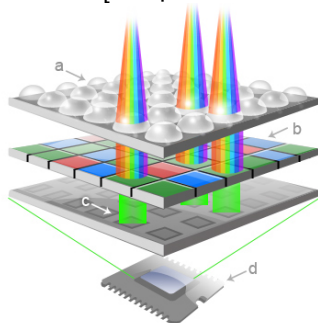

e) True view

- Remember this example?
- In this case the window acts as a pinhole camera into the room

Digital Camera

[Adopted from S. Seitz]

- A digital camera replaces film with a sensor array
- Each cell in the array is a light-sensitive diode that converts photons to electrons
- <http://electronics.howstuffworks.com/cameras-photography/digital/digital-camera.htm>

Image Formation

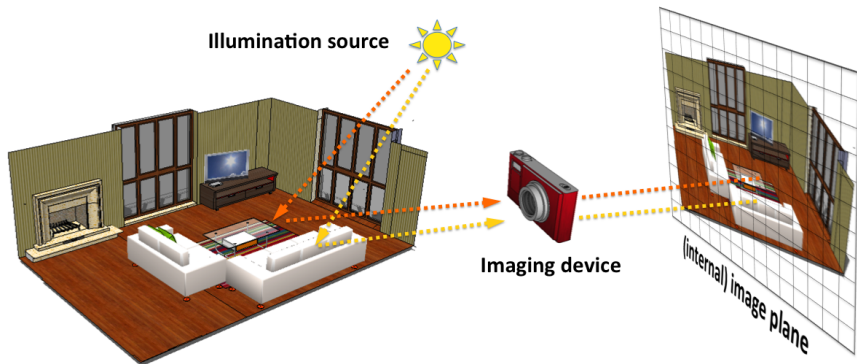

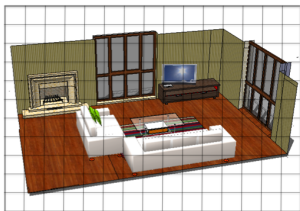

Image formation process producing a particular image depends on:

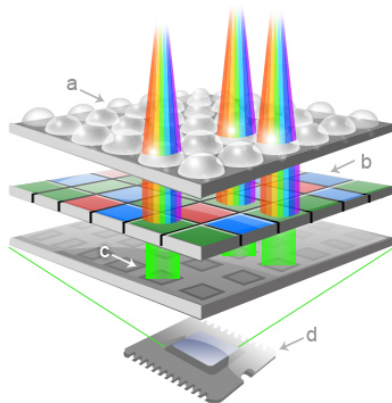

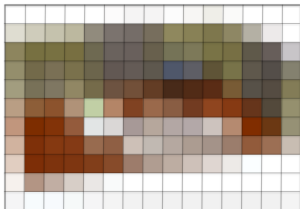

- lighting conditions
- scene geometry
- surface properties
- camera optics

Digital Image

Continuous image projected to sensor array

Sampling and quantization

<http://pho.to/media/images/digital/digital-sensors.jpg>

- Sample the 2D space on a regular grid
- Quantize each sample (round to nearest integer)

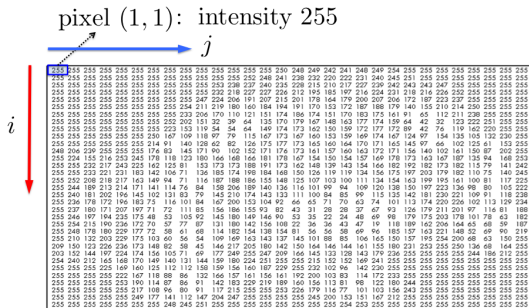

Digital Image

- Image is a matrix with integer values
- We will typically denote it with I

[illegible]

Digital Image

- Image is a matrix with integer values
- We will typically denote it with I
- $I(i, j)$ is called **intensity**

Digital Image

- Image is a matrix with integer values
- We will typically denote it with I
- $I(i, j)$ is called **intensity**
- Matrix I can be $m \times n$ (grayscale)

[illegible]

Digital Image

- Image is a matrix with integer values
- We will typically denote it with I
- $I(i,j)$ is called **intensity**
- Matrix I can be $m \times n$ (grayscale)
- or $m \times n \times 3$ (color)

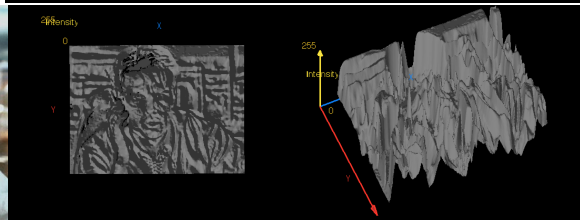

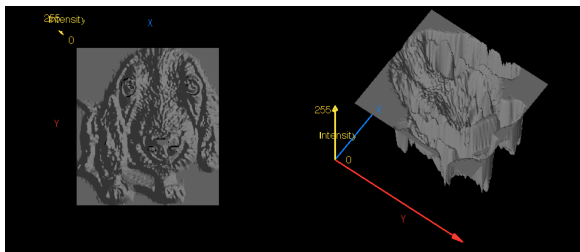

[illegible]

Digital Image

- Image is a matrix with integer values
- We will typically denote it with I
- $I(i,j)$ is called **intensity**
- Matrix I can be $m \times n$ (grayscale)
- or $m \times n \times 3$ (color)

[illegible][illegible][illegible]

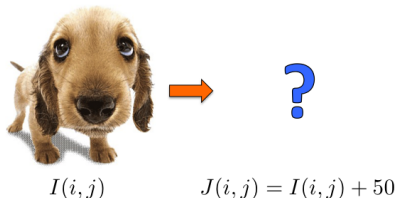

Intensity

- We can think of a (grayscale) image as a function $f : \mathbb{R}^2 \rightarrow \mathbb{R}$ giving the intensity at position (i, j)
- Intensity 0 is black and 255 is white

Image Transformations

- As with any function, we can apply operators to an image, e.g.:

- We'll talk about special kinds of operators, **correlation** and **convolution** (linear filtering)

[Adapted from: N. Snavely]

Image Transformations

- As with any function, we can apply operators to an image, e.g.:

$I(i, j)$

$J(i, j) = I(i, j) + 50$

$J(i, j) = I(i, -j)$

$I(i, j) \cdot (I(i, j) < 250)$

- We'll talk about special kinds of operators, **correlation** and **convolution** (linear filtering)

[Adapted from: N. Snavely]

Image Transformations

- As with any function, we can apply operators to an image, e.g.:

$I(i, j)$

$J(i, j) = I(i, j) + 50$

$J(i, j) = I(i, -j)$

$I(i, j) \cdot (I(i, j) < 250)$

- We'll talk about special kinds of operators, **correlation** and **convolution** (linear filtering)

Linear Filters

Reading: Szeliski book, Chapter 3.2

Motivation: Finding Waldo

- How can we find Waldo?

[Source: R. Urtasun]

Answer

- Slide and compare!
- In formal language: **filtering**

Motivation: Noise reduction

- Given a camera and a still scene, how can you reduce noise?

[Source: S. Seitz]

Image Filtering

- Modify the pixels in an image based on some function of a local neighborhood of each pixel
- In other words... Filtering

10	5	3
4	5	1
1	1	7

Local image data

Some function

	7	

Modified image data

[Source: L. Zhang]

Applications of Filtering

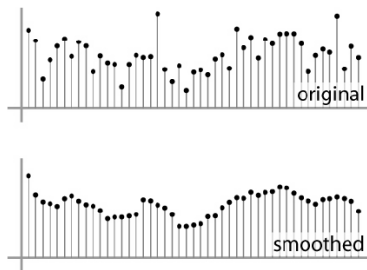

- Enhance an image, e.g., **denoise**.
- Detect patterns, e.g., **template matching**.
- Extract information, e.g., **texture, edges**.

Applications of Filtering

- Enhance an image, e.g., **denoise**. Let's talk about this first
- Detect patterns, e.g., **template matching**.
- Extract information, e.g., **texture, edges**.

Noise reduction

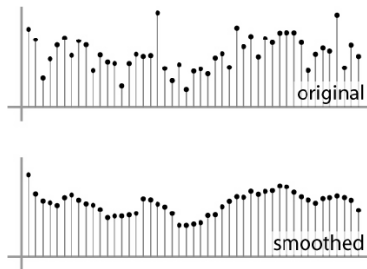

- Simplest thing: replace each pixel by the average of its neighbors.
- This assumes that neighboring pixels are similar, and the noise to be independent from pixel to pixel.

[Source: S. Marschner]

Noise reduction

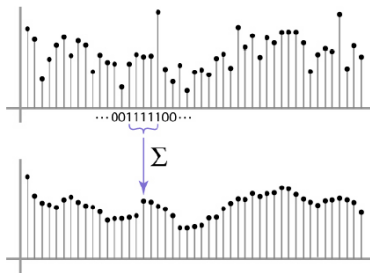

- Simplest thing: replace each pixel by the average of its neighbors.
- This assumes that neighboring pixels are similar, and the noise to be independent from pixel to pixel.

[Source: S. Marschner]

Noise reduction

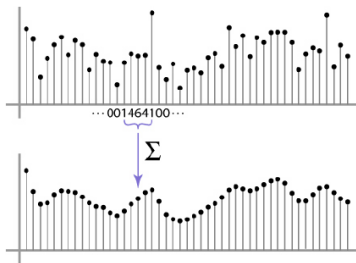

- Simplest thing: replace each pixel by the average of its neighbors
- This assumes that neighboring pixels are similar, and the noise to be independent from pixel to pixel.
- **Moving average** in 1D: $[1, 1, 1, 1, 1]/5$

[Source: S. Marschner]

Noise reduction

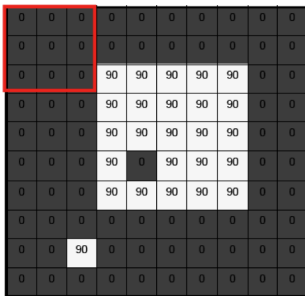

- Simplest thing: replace each pixel by the average of its neighbors
- This assumes that neighboring pixels are similar, and the noise to be independent from pixel to pixel.
- Non-uniform weights $[1, 4, 6, 4, 1] / 16$

Linear Filtering: Correlation

- Involves weighted combinations of pixels in small neighborhoods:

$$G(i,j) = \frac{1}{(2k+1)^2} \sum_{u=-k}^k \sum_{v=-k}^k I(i+u, j+v)$$

- The output pixels value is determined as a weighted sum of input pixel values

$$G(i,j) = \sum_{u=-k}^k \sum_{v=-k}^k F(u,v) \cdot I(i+u, j+v)$$

Linear Filtering: Correlation

- Involves weighted combinations of pixels in small neighborhoods:

$$G(i,j) = \frac{1}{(2k+1)^2} \sum_{u=-k}^k \sum_{v=-k}^k I(i+u, j+v)$$

- The output pixels value is determined as a weighted sum of input pixel values

$$G(i,j) = \sum_{u=-k}^k \sum_{v=-k}^k F(u,v) \cdot I(i+u, j+v)$$

- The entries of the weight **kernel** or **mask** $F(u,v)$ are often called the **filter coefficients**.

Linear Filtering: Correlation

- Involves weighted combinations of pixels in small neighborhoods:

$$G(i,j) = \frac{1}{(2k+1)^2} \sum_{u=-k}^k \sum_{v=-k}^k I(i+u, j+v)$$

- The output pixels value is determined as a weighted sum of input pixel values

$$G(i,j) = \sum_{u=-k}^k \sum_{v=-k}^k F(u,v) \cdot I(i+u, j+v)$$

- The entries of the weight **kernel** or **mask** $F(u,v)$ are often called the **filter coefficients**.
- This operator is the **correlation** operator

$$G = F \otimes I$$

Linear Filtering: Correlation

filtered

- What if the filter size was 5×5 instead of 3×3 ?

[Source: K. Graumann]

Gaussian filter

- What if we want nearest neighboring pixels to have the most influence on the output?
- Removes high-frequency components from the image (low-pass filter).

$I(i, j)$

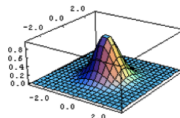

$\frac{1}{16}$

1	2	1
2	4	2
1	2	1

$F(i, j)$

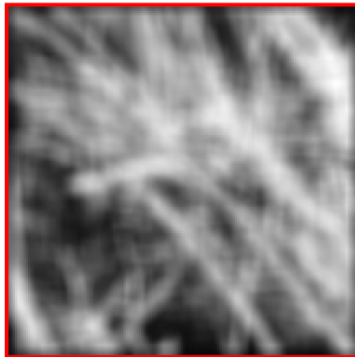

This kernel is an approximation of a 2d Gaussian function:

$$h(u, v) = \frac{1}{2\pi\sigma^2} e^{-\frac{u^2+v^2}{\sigma^2}}$$

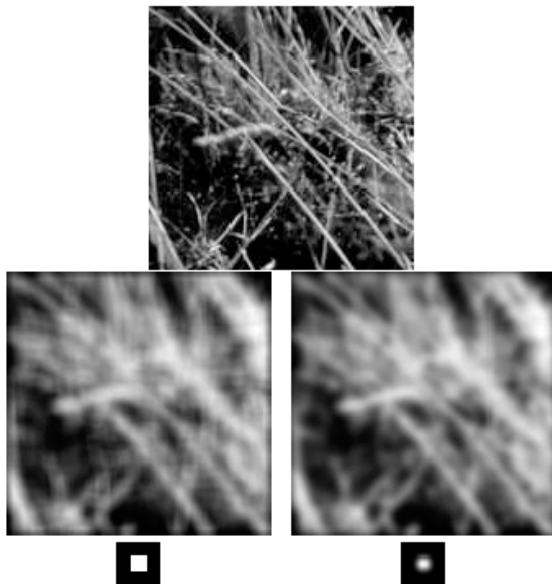

[Source: S. Seitz]

Smoothing with a Gaussian

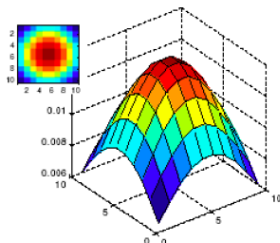

[Source: K. Grauman]

Mean vs Gaussian

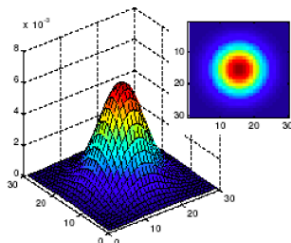

Gaussian filter: Parameters

- **Size of filter or mask:** Gaussian function has infinite support, but discrete filters use finite kernels.

$\sigma = 5$ with
10 x 10
kernel

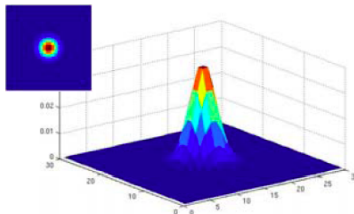

$\sigma = 5$ with
30 x 30
kernel

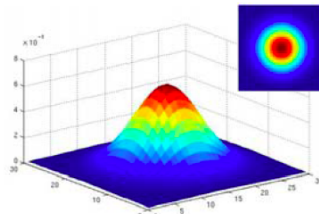

[Source: K. Grauman]

Gaussian filter: Parameters

- **Variance of the Gaussian:** determines extent of smoothing.

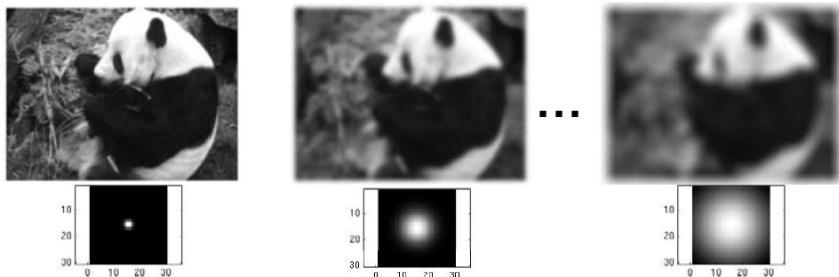

$\sigma = 2$ with
30 x 30
kernel

$\sigma = 5$ with
30 x 30
kernel

[Source: K. Grauman]

Gaussian filter: Parameters

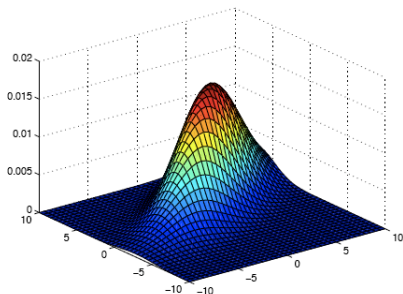

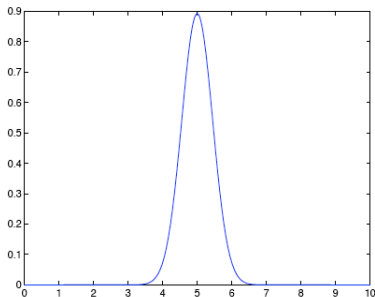

```
for sigma=1:3:10
    h = fspecial('gaussian', fsize, sigma);
    out = imfilter(im, h);
    imshow(out);
    pause;
end
```

[Source: K. Grauman]

Is this the most general Gaussian?

- No, the most general form for $\mathbf{x} \in \mathbb{R}^d$

$$\mathcal{N}(\mathbf{x}; \mu, \Sigma) = \frac{1}{(2\pi)^{d/2} |\Sigma|^{1/2}} \exp \left(-\frac{1}{2} (\mathbf{x} - \mu)^T \Sigma^{-1} (\mathbf{x} - \mu) \right)$$

- But the simplified version is typically used for filtering.

Properties of the Smoothing

- All values are positive.
- They all sum to 1.

Properties of the Smoothing

- All values are positive.
- They all sum to 1.
- Amount of smoothing proportional to mask size.

Properties of the Smoothing

- All values are positive.
- They all sum to 1.
- Amount of smoothing proportional to mask size.
- Remove high-frequency components; low-pass filter.

Properties of the Smoothing

- All values are positive.

- Remove high-frequency components; low-pass filter.

Finding Waldo

image /

- How can we use what we just learned to find Waldo?

Finding Waldo

image I

filter F

- Is correlation a good choice?

A Slight Detour: Correlation in Matrix Form

- Remember correlation:

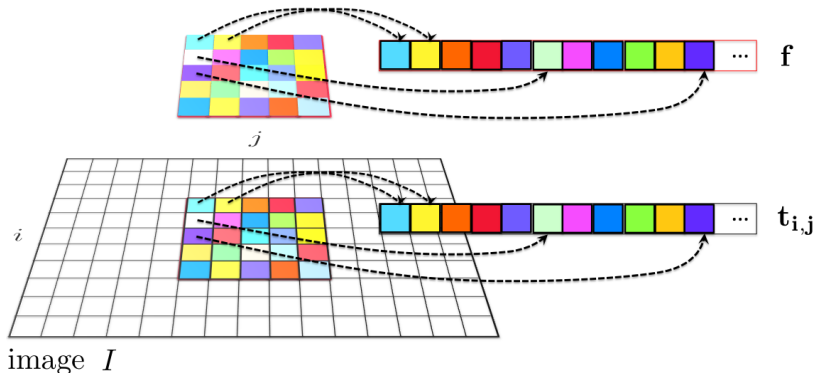

$$G(i, j) = \sum_{u=-k}^k \sum_{v=-k}^k F(u, v) \cdot I(i + u, j + v)$$

- Can we write that in a more compact form (with vectors)?

A Slight Detour: Correlation in Matrix Form

- Remember correlation:

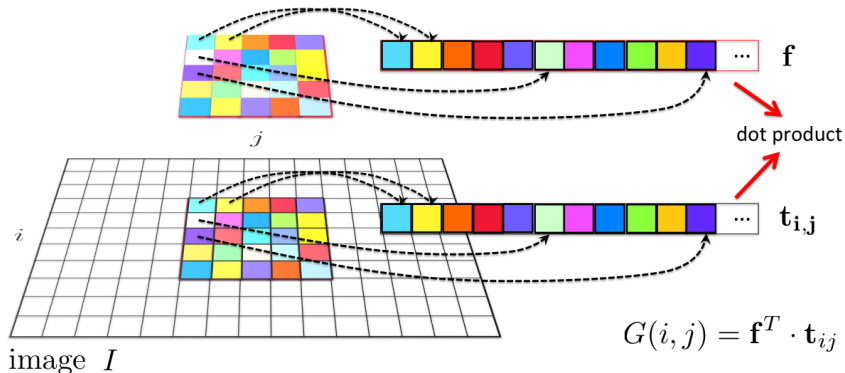

$$G(i,j) = \sum_{u=-k}^k \sum_{v=-k}^k F(u,v) \cdot I(i+u, j+v)$$

A Slight Detour: Correlation in Matrix Form

- Remember correlation:

$$G(i, j) = \sum_{u=-k}^k \sum_{v=-k}^k F(u, v) \cdot I(i + u, j + v)$$

A Slight Detour: Correlation in Matrix Form

- Remember correlation:

$$G(i, j) = \sum_{u=-k}^k \sum_{v=-k}^k F(u, v) \cdot I(i + u, j + v)$$

- Can we write that in a more compact form (with vectors)?
- Define $\mathbf{f} = F(:)$, $T_{ij} = I(i - k : i + k, j - k : j + k)$, and $\mathbf{t}_{ij} = T_{ij}(:)$

$$G(i, j) = \mathbf{f}^T \cdot \mathbf{t}_{ij}$$

where \cdot is a dot product

A Slight Detour: Correlation in Matrix Form

- Remember correlation:

$$G(i, j) = \sum_{u=-k}^k \sum_{v=-k}^k F(u, v) \cdot I(i + u, j + v)$$

- Can we write that in a more compact form (with vectors)?
- Define $\mathbf{f} = F(:)$, $T_{ij} = I(i - k : i + k, j - k : j + k)$, and $\mathbf{t}_{ij} = T_{ij}(:)$

$$G(i, j) = \mathbf{f}^T \cdot \mathbf{t}_{ij}$$

where \cdot is a dot product

- Homework:** Can we write full correlation $G = F \otimes I$ in matrix form?

A Slight Detour: Correlation in Matrix Form

- Remember correlation:

$$G(i, j) = \sum_{u=-k}^k \sum_{v=-k}^k F(u, v) \cdot I(i + u, j + v)$$

- Can we write that in a more compact form (with vectors)?
- Define $\mathbf{f} = F(:)$, $T_{ij} = I(i - k : i + k, j - k : j + k)$, and $\mathbf{t}_{ij} = T_{ij}(:)$

$$G(i, j) = \mathbf{f}^T \cdot \mathbf{t}_{ij}$$

where \cdot is a dot product

- Finding Waldo: How could we ensure to get the best “score” (e.g. 1) for an image crop that looks exactly like our filter?

A Slight Detour: Correlation in Matrix Form

- Remember correlation:

$$G(i, j) = \sum_{u=-k}^k \sum_{v=-k}^k F(u, v) \cdot I(i + u, j + v)$$

- Can we write that in a more compact form (with vectors)?
- Define $\mathbf{f} = F(:)$, $T_{ij} = I(i - k : i + k, j - k : j + k)$, and $\mathbf{t}_{ij} = T_{ij}(:)$

$$G(i, j) = \mathbf{f}^T \cdot \mathbf{t}_{ij}$$

where \cdot is a dot product

- Finding Waldo: How could we ensure to get the best “score” (e.g. 1) for an image crop that looks exactly like our filter?
- Normalized cross-correlation:**

$$G(i, j) = \frac{\mathbf{f}^T \cdot \mathbf{t}_{ij}}{\|\mathbf{f}\| \cdot \|\mathbf{t}_{ij}\|}$$

Back to Waldo

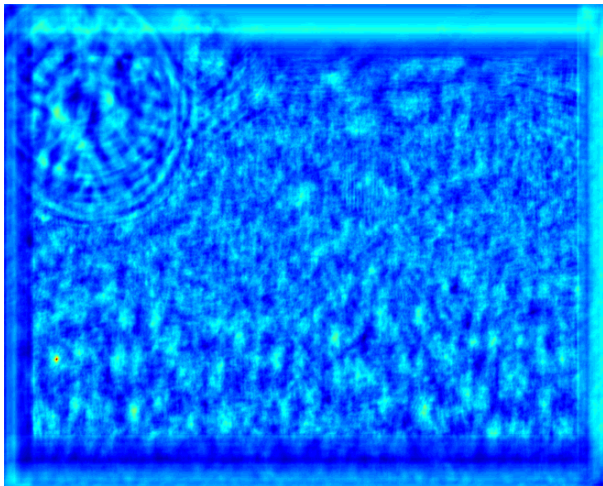

image I

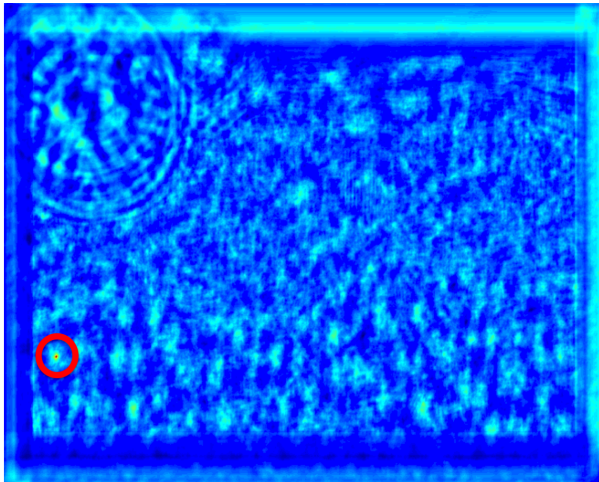

filter F

Back to Waldo

- Result of normalized cross-correlation

Back to Waldo

- Find the highest peak

Back to Waldo

And put a bounding box (rectangle the size of the template) at the point!

Back to Waldo

- **Homework:** Do it yourself! Code on class webpage. Don't cheat ;)

- **Convolution** operator

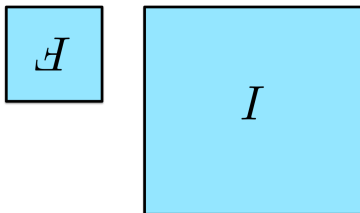

$$G(i, j) = \sum_{u=-k}^k \sum_{v=-k}^k F(u, v) \cdot I(i - u, j - v)$$

Convolution

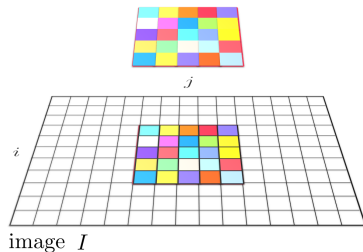

- **Convolution** operator

$$G(i, j) = \sum_{u=-k}^k \sum_{v=-k}^k F(u, v) \cdot I(i - u, j - v)$$

- **Equivalent** to flipping the filter in both dimensions (bottom to top, right to left) and apply correlation.

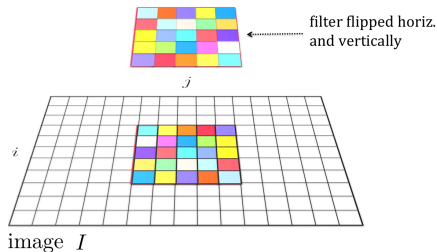

Correlation vs Convolution

Correlation

=

Convolution

Correlation vs Convolution

- For a Gaussian or box filter, how will the outputs $F * I$ and $F \otimes I$ differ?

Correlation vs Convolution

- For a Gaussian or box filter, how will the outputs $F * I$ and $F \otimes I$ differ?
- How will the outputs differ for:

$$\begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{pmatrix}$$

Correlation vs Convolution

- For a Gaussian or box filter, how will the outputs $F * I$ and $F \otimes I$ differ?

- How will the outputs differ for:

$$\begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{pmatrix}$$

- If the input is an impulse signal, how will the outputs differ? $\delta * I$ and $\delta \otimes I$?

"Optical" Convolution

Properties of Convolution

Commutative : $f * g = g * f$

Associative : $f * (g * h) = (f * g) * h$

Distributive : $f * (g + h) = f * g + f * h$

Assoc. with scalar multiplier : $\lambda \cdot (f * g) = (\lambda \cdot f) * h$

Properties of Convolution

Commutative : $f * g = g * f$

Associative : $f * (g * h) = (f * g) * h$

Distributive : $f * (g + h) = f * g + f * h$

Assoc. with scalar multiplier : $\lambda \cdot (f * g) = (\lambda \cdot f) * h$

- The Fourier transform of two convolved images is the product of their individual Fourier transforms:

$$\mathcal{F}(f * g) = \mathcal{F}(f) \cdot \mathcal{F}(g)$$

Properties of Convolution

Commutative : $f * g = g * f$

Associative : $f * (g * h) = (f * g) * h$

Distributive : $f * (g + h) = f * g + f * h$

Assoc. with scalar multiplier : $\lambda \cdot (f * g) = (\lambda \cdot f) * h$

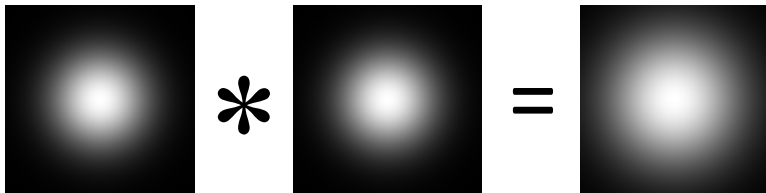

- The Fourier transform of two convolved images is the product of their individual Fourier transforms:

$$\mathcal{F}(f * g) = \mathcal{F}(f) \cdot \mathcal{F}(g)$$

- **Homework:** Why is this good news?
- **Hint:** Think of complexity of convolution and Fourier Transform
- Both correlation and convolution are **linear shift-invariant (LSI) operators**: the effect of the operator is the same everywhere.

Gaussian Filter

- Convolution with itself is another Gaussian

- Convolving twice with Gaussian kernel of width σ is the same as convolving once with kernel of width $\sigma\sqrt{2}$
- We don't need to filter twice, just once with a bigger kernel

[Source: K. Grauman]

Separable Filters: Speed-up Trick!

- The process of performing a convolution requires K^2 operations per pixel, where K is the size (width or height) of the convolution filter.

Separable Filters: Speed-up Trick!

- The process of performing a convolution requires K^2 operations per pixel, where K is the size (width or height) of the convolution filter.
- Can we do faster?

Separable Filters: Speed-up Trick!

- The process of performing a convolution requires K^2 operations per pixel, where K is the size (width or height) of the convolution filter.
- Can we do faster?
- In many cases (**not all!**), this operation can be speed up by first performing a 1D horizontal convolution followed by a 1D vertical convolution, **requiring only $2K$ operations**.

Separable Filters: Speed-up Trick!

- The process of performing a convolution requires K^2 operations per pixel, where K is the size (width or height) of the convolution filter.
- Can we do faster?
- In many cases (**not all!**), this operation can be speed up by first performing a 1D horizontal convolution followed by a 1D vertical convolution, **requiring only $2K$ operations**.
- If this is possible, then the convolution filter is called **separable**.

Separable Filters: Speed-up Trick!

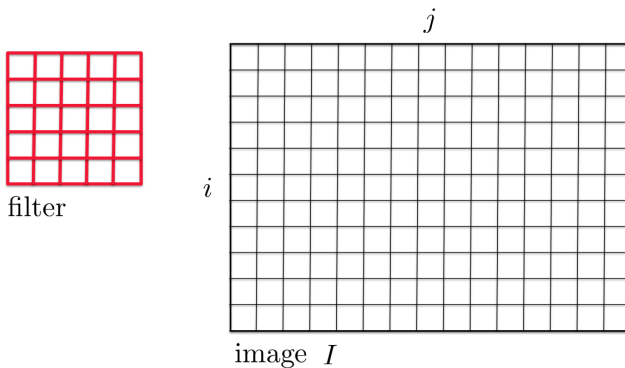

- The process of performing a convolution requires K^2 operations per pixel, where K is the size (width or height) of the convolution filter.
- Can we do faster?
- In many cases (**not all!**), this operation can be speed up by first performing a 1D horizontal convolution followed by a 1D vertical convolution, **requiring only $2K$ operations**.
- If this is possible, then the convolution filter is called **separable**.
- And it is the outer product of two filters:

$$\mathbf{F} = \mathbf{v} \mathbf{h}^T$$

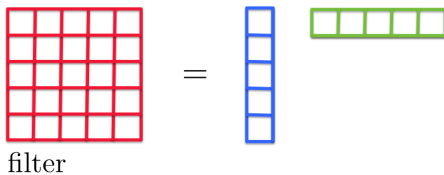

- **Homework:** Think **why** in the case of separable filters 2D convolution is the same as two 1D convolutions

Separable Filters: Gaussian filters

- One famous separable filter we already know:

Gaussian : $f(x, y) = \frac{1}{2\pi\sigma^2} e^{-\frac{x^2+y^2}{\sigma^2}}$
 $= \left(\frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{x^2}{\sigma^2}} \right) \cdot \left(\frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{y^2}{\sigma^2}} \right)$

Let's play a game...

Is this separable? If yes, what's the separable version?

$$\frac{1}{K^2}$$

1	1	...	1
1	1	...	1
\vdots	\vdots	1	\vdots
1	1	...	1

[Source: R. Urtasun]

Let's play a game...

Is this separable? If yes, what's the separable version?

$$\frac{1}{K^2}$$

1	1	...	1
1	1	...	1
\vdots	\vdots	1	\vdots
1	1	...	1

$$\frac{1}{K}$$

1	1	...	1
---	---	-----	---

What does this filter do?

[Source: R. Urtasun]

Let's play a game...

Is this separable? If yes, what's the separable version?

$$\frac{1}{16} \begin{array}{|c|c|c|} \hline 1 & 2 & 1 \\ \hline 2 & 4 & 2 \\ \hline 1 & 2 & 1 \\ \hline \end{array}$$

[Source: R. Urtasun]

Let's play a game...

Is this separable? If yes, what's the separable version?

$$\frac{1}{16}$$

1	2	1
2	4	2
1	2	1

$$\frac{1}{4}$$

1	2	1
---	---	---

What does this filter do?

[Source: R. Urtasun]

Let's play a game...

Is this separable? If yes, what's the separable version?

$\frac{1}{8}$	-1	0	1
	-2	0	2
	-1	0	1

[Source: R. Urtasun]

Let's play a game...

Is this separable? If yes, what's the separable version?

$$\frac{1}{8} \begin{array}{|c|c|c|} \hline -1 & 0 & 1 \\ \hline -2 & 0 & 2 \\ \hline -1 & 0 & 1 \\ \hline \end{array}$$
$$\frac{1}{2} \begin{array}{|c|c|c|} \hline -1 & 0 & 1 \\ \hline \end{array}$$

What does this filter do?

How can we tell if a given filter F is indeed separable?

- Inspection... this is what we were doing.

How can we tell if a given filter F is indeed separable?

- Inspection... this is what we were doing.
- Looking at the analytic form of it.

How can we tell if a given filter F is indeed separable?

- Inspection... this is what we were doing.
- Looking at the analytic form of it.
- Look at the **singular value decomposition (SVD)**, and if only one singular value is non-zero, then it is separable

$$F = \mathbf{U}\mathbf{\Sigma}\mathbf{V}^T = \sum_i \sigma_i u_i v_i^T$$

with $\mathbf{\Sigma} = \text{diag}(\sigma_i)$.

How can we tell if a given filter F is indeed separable?

- Inspection... this is what we were doing.
- Looking at the analytic form of it.
- Look at the **singular value decomposition (SVD)**, and if only one singular value is non-zero, then it is separable

$$F = \mathbf{U}\mathbf{\Sigma}\mathbf{V}^T = \sum_i \sigma_i u_i v_i^T$$

with $\mathbf{\Sigma} = \text{diag}(\sigma_i)$.

- Matlab: `[U,S,V] = SVD(F);`

How can we tell if a given filter F is indeed separable?

- Inspection... this is what we were doing.
- Looking at the analytic form of it.
- Look at the **singular value decomposition (SVD)**, and if only one singular value is non-zero, then it is separable

$$F = \mathbf{U}\Sigma\mathbf{V}^T = \sum_i \sigma_i u_i v_i^T$$

with $\Sigma = \text{diag}(\sigma_i)$.

- Matlab: $[\mathbf{U}, \mathbf{S}, \mathbf{V}] = \text{SVD}(\mathbf{F})$;
- $\sqrt{\sigma_1} \mathbf{u}_1$ and $\sqrt{\sigma_1} \mathbf{v}_1^T$ are the vertical and horizontal filter.

Summary – Stuff You Should Know

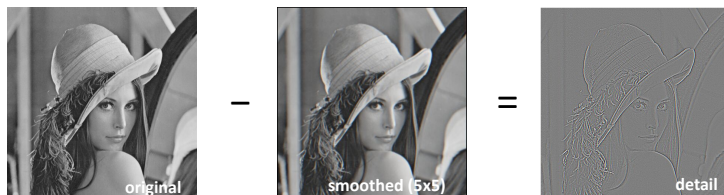

- **Correlation:** Slide a filter across image and compare (via dot product)
- **Convolution:** Flip the filter to the right and down and do correlation
- **Smooth** image with a Gaussian kernel: bigger σ means more blurring
- **Some** filters (like Gaussian) are **separable**: you can filter faster. First apply 1D convolution to each row, followed by another 1D conv. to each column
- Applying first a Gaussian filter with σ_1 and then another Gaussian with σ_2 is the same as applying one Gaussian filter with $\sigma = \sqrt{\sigma_1^2 + \sigma_2^2}$

Matlab functions:

- **IMFILTER:** can do both correlation and convolution
- **CORR2, FILTER2:** correlation, **NORMXCORR2** normalized correlation
- **CONV2:** does convolution
- **FSPECIAL:** creates special filters including a Gaussian

Edges
