Stereo

Epipolar Geometry for General Cameras
Stereo

Epipolar geometry

- Case with two cameras with parallel optical axes
- General case ← Now this
Epipolar Geometry

- If I can always mount two cameras parallel to each other, why do I need to learn math for the general case?
Let’s say that you want to reconstruct a CN tower in 3D
Epipolar Geometry

- Let’s say that you want to reconstruct a CN tower in 3D
- One out of endless possibilities of why you would do that:
  - You can print it with a 3D printer to get a nice pocket or not-so-pocket edition (better than those that are sold in Chinatown)
  - Give it to your mum for Christmas (say it’s a present from CSC420)
Epipolar Geometry

- Let’s say that you want to reconstruct a CN tower in 3D
- You obviously can’t get a good 360 shot of the CN tower with just parallel cameras. Particularly not the top of the CN tower which is very high up.
Epipolar Geometry

- Let’s say that you want to reconstruct a CN tower in 3D
- You obviously can’t get a good 360 shot of the CN tower with just parallel cameras. Particularly not the top of the tower.
- But you can download great images of the tower from the web without even needing to leave the house.
Epipolar Geometry

- But these images are not taken from parallel cameras...
Photosynth

- You could even do part of Venice...

Figure: https://www.youtube.com/watch?v=HrgHFDPJHxo

Last World Cup was monitored with 14 high-speed cameras, capturing 500 frames per second, and could accurately detect ball motion to within 5mm. 2,000 tests performed, all successful. By German company Goal Control.
Stereo – General Case
Ready for the math?
Some notation: the left and right epipole
All points from the projective line $O_l p_l$ project to a line on the right image plane. This time the line is not (necessarily) horizontal.
Stereo: Parallel Calibrated Cameras

- The line goes through the right epipole.

![Diagram showing parallel calibrated cameras with epipoles and coordinates](image-url)
Similarly, all points from the projective line \( O_r p_r \) project to a line on the left image plane. This line goes through the left epipole.
The reason for all this is simple: points $O_l$, $O_r$, and a point $P$ in 3D lie on a plane. We call this the **epipolar plane**. This plane intersects each image plane in a line. We call these lines **epipolar lines**.
Obviously a different point in 3D will form a different epipolar plane and therefore different epipolar lines. But these epipolar lines go through epipoles as well.
Why are we even dumping all this notation? Are epipolar lines, epipoles, etc somehow useful?
Stereo: Parallel Calibrated Cameras

- Remember what we did for parallel cameras? We were matching points in the left and right image, giving us a point in 3D. We want the same now.
- Epipolar geometry is useful because it constrains our search for the matches:
  - For each point $p_l$ we need to search for $p_r$ only on an epipolar line (much simpler than if I need to search in the full image)
  - All matches lie on lines that intersect in epipoles. This gives another constraint.
Epipolar geometry: Examples

- Example of epipolar lines for converging cameras

Stereo for General Cameras

How we’ll get 3D:

- We first need to figure out on which line we need to search for the matches for each $p_i$.
- Each point in left image maps to a line in right image. We will see that this mapping can be described by a single $3 \times 3$ matrix $F$, called the fundamental matrix.
Stereo for General Cameras

How we’ll get 3D:

- We first need to figure out on which line we need to search for the matches for each \( p_i \)

- Each point in left image maps to a line in right image. We will see that this mapping can be described by a single \( 3 \times 3 \) matrix \( F \), called the fundamental matrix

- Given \( F \), you can rectify the images such that the epipolar lines are horizontal

- Each point in left image maps to a line in right image. We will see that this mapping can be described by a single \( 3 \times 3 \) matrix \( F \), called the **fundamental matrix**.
- Given \( F \), you can **rectify** the images such that the epipolar lines are horizontal.
- And we know how to take it from there.
The fundamental matrix $F$ is defined as $l_r = Fp_l$, where $l_r$ is the right epipolar line corresponding to $p_l$.

$F$ is a $3 \times 3$ matrix
The fundamental matrix $F$ is defined as $l_r = Fp_l$, where $l_r$ is the right epipolar line corresponding to $p_l$.

- $F$ is a $3 \times 3$ matrix
- For any point $p_l$ its epipolar line is defined by the same matrix $F$. 

The Fundamental Matrix

Sanja Fidler
CSC420: Intro to Image Understanding
The fundamental matrix $F$ is defined as $l_r = Fp_l$, where $l_r$ is the right epipolar line corresponding to $p_l$.

- $F$ is a $3 \times 3$ matrix.
- For any point $p_l$ its epipolar line is defined by the same matrix $F$. 
The Fundamental Matrix

- Extend the line $O_l p_l$ until you hit a plane $\pi$ (arbitrary)
- Find the image $p_r$ of $X$ in the right camera
The Fundamental Matrix

- Extend the line $O_l p_l$ until you hit a plane $\pi$ (arbitrary)
- Find the image $p_r$ of $X$ in the right camera
- Get epipolar line $l_r$ from $e_r$ to $p_r$: $l_r = e_r \times p_r$
The Fundamental Matrix

- Extend the line $O_I p_I$ until you hit a plane $\pi$ (arbitrary)
- Find the image $p_r$ of $X$ in the right camera
- Get epipolar line $l_r$ from $e_r$ to $p_r$: $l_r = e_r \times p_r$
- Points $p_I$ and $p_r$ are related via homography: $p_r = H_{\pi} p_I$
Extend the line $O_l p_l$ until you hit a plane $\pi$ (arbitrary)

Find the image $p_r$ of $X$ in the right camera

Get epipolar line $l_r$ from $e_r$ to $p_r$: $l_r = e_r \times p_r$

Points $p_l$ and $p_r$ are related via homography: $p_r = H_\pi p_l$

Then: $l_r = e_r \times p_r = e_r \times H_\pi p_l = F p_l$
Extend the line $O_l p_l$ until you hit a plane $\pi$ (arbitrary)

Find the image $p_r$ of $X$ in the right camera

Get epipolar line $l_r$ from $e_r$ to $p_r$: $l_r = e_r \times p_r$

Points $p_l$ and $p_r$ are related via homography: $p_r = H_\pi p_l$

Then: $l_r = e_r \times p_r = e_r \times H_\pi p_l = Fp_l$

The fundamental matrix $F$ is defined $l_r = Fp_l$

[Adopted from: R. Urtasun]
The Fundamental Matrix

- Extend the line \( O_l p_l \) until you hit a plane \( \pi \) (arbitrary)
- Find the image \( p_r \) of \( X \) in the right camera
- Get epipolar line \( l_r \) from \( e_r \) to \( p_r \): \( l_r = e_r \times p_r \)
- Points \( p_l \) and \( p_r \) are related via homography: \( p_r = H_\pi p_l \)
- Then: \( l_r = e_r \times p_r = e_r \times H_\pi p_l = F p_l \)
- The fundamental matrix \( F \) is defined \( l_r = F p_l \)

[Adopted from: R. Urtasun]
The Fundamental Matrix

- The fundamental matrix $F$ is defined as $l_r = Fp_l$, where $l_r$ is the right epipolar line corresponding to $p_l$.
- $F$ is a $3 \times 3$ matrix
- For any point $p_l$ its epipolar line is defined by the same matrix $F$.
- Do a trick:

$$p_r^T \cdot l_r = p_r^T Fp_l$$
The fundamental matrix $F$ is defined as $l_r = Fp_l$, where $l_r$ is the right epipolar line corresponding to $p_l$.

- $F$ is a $3 \times 3$ matrix

- For any point $p_l$, its epipolar line is defined by the same matrix $F$.

- Do a trick:

$$p_r^T \cdot l_r = p_r^T Fp_l$$

$= 0$, because $p_r$ lies on a line $l_r$
The Fundamental Matrix

- The fundamental matrix $F$ is defined as $l_r = Fp_l$, where $l_r$ is the right epipolar line corresponding to $p_l$.
- $F$ is a $3 \times 3$ matrix
- For any point $p_l$ its epipolar line is defined by the same matrix $F$.
- So:

$$ p_r^T Fp_l = 0 $$

for any match ($p_l, p_r$) (main thing to remember)!!

- We can compute $F$ from a few correspondences. How do we get these correspondences?
The Fundamental Matrix

- The fundamental matrix $F$ is defined as $l_r = Fp_l$, where $l_r$ is the right epipolar line corresponding to $p_l$.

- For any point $p_l$ its epipolar line is defined by the same matrix $F$.
- So:

$$p_r^T F p_l = 0$$

for any match $(p_l, p_r)$ (main thing to remember)!!

- We can compute $F$ from a few correspondences. How do we get these correspondences?
  - By finding reliable matches across two images without any constraints. We know how to do this from our DVD matching example.
  - We get a linear system.
The Fundamental Matrix

- The fundamental matrix $F$ is defined as $l_r = Fp_l$, where $l_r$ is the right epipolar line corresponding to $p_l$.
- $F$ is a $3 \times 3$ matrix
- For any point $p_l$ its epipolar line is defined by the same matrix $F$.
- So:

$$p_r^T F p_l = 0$$

for any match $(p_l, p_r)$ (main thing to remember)!!

- We can compute $F$ from a few correspondences. How do we get these correspondences?
- By finding reliable matches across two images without any constraints. We know how to do this from our DVD matching example.
- We get a linear system.
The Fundamental Matrix

- Let’s say that you found a few matching points in both images: 
  \((x_{l,1}, y_{l,1}) \leftrightarrow (x_{r,1}, y_{r,1}), \ldots, (x_{l,n}, y_{l,n}) \leftrightarrow (x_{r,n}, y_{r,n})\), where \(n \geq 7\)

- Then you can get the parameters \(f := [F_{11}, F_{12}, \ldots, F_{33}]\) by solving:

\[
\begin{bmatrix}
  x_{r,1} & x_{l,1} & x_{r,1} y_{l,1} & x_{r,1} x_{l,1} & y_{r,1} y_{l,1} & y_{r,1} x_{l,1} & y_{l,1} & 1 \\
  \vdots \\
  x_{r,n} & x_{l,n} & x_{r,n} y_{l,n} & x_{r,n} x_{l,n} & y_{r,n} y_{l,n} & y_{r,n} x_{l,n} & y_{l,n} & 1
\end{bmatrix} f = 0
\]

- How many correspondences do we need?
  - \(F\) has 9 elements, but we don’t care about scaling, so 8 elements.
The Fundamental Matrix

- Let's say that you found a few matching points in both images:
  \((x_{l,1}, y_{l,1}) \leftrightarrow (x_{r,1}, y_{r,1}), \ldots, (x_{l,n}, y_{l,n}) \leftrightarrow (x_{r,n}, y_{r,n})\), where \(n \geq 7\)

- Then you can get the parameters \(f := [F_{11}, F_{12}, \ldots, F_{33}]\) by solving:

\[
\begin{bmatrix}
  x_{r,1}x_{l,1} & x_{r,1}y_{l,1} & x_{r,1} & y_{r,1}x_{l,1} & y_{r,1}y_{l,1} & y_{r,1}x_{l,1} & y_{l,1} & 1 \\
  \vdots & & & & & & & \\
  x_{r,n}x_{l,n} & x_{r,n}y_{l,n} & x_{r,n} & y_{r,n}x_{l,n} & y_{r,n}y_{l,n} & y_{r,n}x_{l,n} & y_{l,n} & 1
\end{bmatrix} f = 0
\]

- How many correspondences do we need?
  - \(F\) has 9 elements, but we don’t care about scaling, so 8 elements.
  - Turns out it really only has 7.
The Fundamental Matrix

- Let's say that you found a few matching points in both images:
  \((x_l,1, y_l,1) \leftrightarrow (x_r,1, y_r,1), \ldots, (x_l,n, y_l,n) \leftrightarrow (x_r,n, y_r,n)\), where \(n \geq 7\)
- Then you can get the parameters \(f := [F_{11}, F_{12}, \ldots, F_{33}]\) by solving:

\[
\begin{bmatrix}
  x_r,1 x_l,1 & x_r,1 y_l,1 & x_r,1 y_r,1 x_l,1 & y_r,1 y_l,1 & y_r,1 x_l,1 & y_l,1 & 1 \\
  \vdots \\
  x_r,n x_l,n & x_r,n y_l,n & x_r,n y_r,n x_l,n & y_r,n y_l,n & y_r,n x_l,n & y_l,n & 1
\end{bmatrix} f = 0
\]

- How many correspondences do we need?
  - \(F\) has 9 elements, but we don’t care about scaling, so 8 elements.
  - Turns out it really only has 7.
  - We can estimate \(F\) with 7 correspondences. Of course, the more the better (why?).
  - See Zisserman & Hartley’s book for details.
Let’s say that you found a few matching points in both images:
\[(x_{l,1}, y_{l,1}) \leftrightarrow (x_{r,1}, y_{r,1}), \ldots, (x_{l,n}, y_{l,n}) \leftrightarrow (x_{r,n}, y_{r,n})\], where \(n \geq 7\).

Then you can get the parameters \(f := [F_{11}, F_{12}, \ldots, F_{33}]\) by solving:

\[
\begin{bmatrix}
  x_{r,1}x_{l,1} & x_{r,1}y_{l,1} & x_{r,1} & y_{r,1}x_{l,1} & y_{r,1}y_{l,1} & y_{r,1} & x_{l,1} & y_{l,1} & 1 \\
  \vdots \\
  x_{r,n}x_{l,n} & x_{r,n}y_{l,n} & x_{r,n} & y_{r,n}x_{l,n} & y_{r,n}y_{l,n} & y_{r,n} & x_{l,n} & y_{l,n} & 1
\end{bmatrix}
\begin{bmatrix}
f_1 \\
f_2 \\
f_3 \\
f_4 \\
f_5 \\
f_6 \\
f_7 \\
f_8 \\
f_9
\end{bmatrix} = 0
\]

How many correspondences do we need?

- \(F\) has 9 elements, but we don’t care about scaling, so 8 elements.
- Turns out it really only has 7.
- We can estimate \(F\) with 7 correspondences. Of course, the more the better (why?).
- See Zisserman & Hartley’s book for details.
Once we have $F$ we can compute homographies that transform each image plane such that they are parallel (see Zisserman & Hartley’s book).

Once they are parallel, we know how to proceed (matching, etc).

[Source: J. Hays]
Rectification Example

[Source: J. Hays]
Once you have $F$ you can even compute camera projection matrices $P_l$ and $P_r$ (under some ambiguity). You may choose the camera projection matrices like this:

$$P_{left} = \begin{bmatrix} I_{3\times3} & 0 \end{bmatrix}$$  
$$P_{right} = \begin{bmatrix} [e_r]_x F & e_r \end{bmatrix}$$

where notation $[]_x$ stands for: $[a]_x = \begin{bmatrix} 0 & -a_3 & a_2 \\ a_3 & 0 & -a_1 \\ -a_2 & a_1 & 0 \end{bmatrix}$

This means that I don’t need the relative poses of the two cameras, I can compute it!

This is very useful in scenarios where I just grab pictures from the web.
Once you have $F$ you can even compute camera projection matrices $P_l$ and $P_r$ (under some ambiguity). You may choose the camera projection matrices like this:

$$P_{\text{left}} = \begin{bmatrix} I_{3\times3} & 0 \end{bmatrix} \quad P_{\text{right}} = \begin{bmatrix} [e_r]_x F & e_r \end{bmatrix}$$

where notation $[]_x$ stands for: $[a]_x = \begin{bmatrix} 0 & -a_3 & a_2 \\ a_3 & 0 & -a_1 \\ -a_2 & a_1 & 0 \end{bmatrix}$

This means that I don’t need the relative poses of the two cameras, I can compute it!

This is very useful in scenarios where I just grab pictures from the web.

We need one last thing to compute $P_{\text{right}}$, and that’s $e_r$. But this is easy. We know that $e_r$ lies on epipolar line $l_r$, and so: $e_r^T l_r = 0$. We also know that $l_r = Fx_l$. So: $e_r^T Fx_l = 0$ for all $x_l$, and therefore $e_r^T F = 0$. So I can find $e_r$ as the vector that maps $F$ to 0.
Once you have $F$ you can even compute camera projection matrices $P_l$ and $P_r$ (under some ambiguity). You may choose the camera projection matrices like this:

$$P_{left} = \begin{bmatrix} I_{3\times3} & 0 \end{bmatrix} \quad P_{right} = \begin{bmatrix} [e_r]_x F & e_r \end{bmatrix}$$

where notation $[]_x$ stands for: $[a]_x = \begin{bmatrix} 0 & -a_3 & a_2 \\ a_3 & 0 & -a_1 \\ -a_2 & a_1 & 0 \end{bmatrix}$

This means that I don’t need the relative poses of the two cameras, I can compute it!

This is very useful in scenarios where I just grab pictures from the web.

We need one last thing to compute $P_{right}$, and that’s $e_r$. But this is easy. We know that $e_r$ lies on epipolar line $l_r$, and so: $e_r^Tl_r = 0$. We also know that $l_r = Fx_l$. So: $e_r^TFx_l = 0$ for all $x_l$, and therefore $e_r^TF = 0$. So I can find $e_r$ as the vector that maps $F$ to $0$. 
Stereo: Summary

Epipolar geometry

- Case with two cameras with parallel optical axes
- General case
Cameras with parallel optics and known intrinsics and extrinsics:

- You can search for correspondences along horizontal lines.
- The difference in x direction between two correspondences is called disparity:
  \[ \text{disparity} = x_l - x_r \]
- Assuming you know the camera intrinsics and the baseline (distance between the left and right camera center in the world) you can compute the depth:
  \[ Z = \frac{f \cdot T}{\text{disparity}} \]
- Once you have Z (depth), you can also compute X and Y, giving you full 3D.
- Disparity and depth are inversely proportional.

Matlab function:

- `DISPARITYMAP = DISPARITY(Ileft, Iright);`
- Function `SURF` is useful for plotting the point cloud.
Summary – Stuff You Need To Know

General cameras:

- You first find matches in both images without any restriction. You need at least 7 matches, but the more (reliable) matches the better.
- Solve a homogeneous linear system to get the fundamental matrix $F$.
- Given $F$, you can compute homographies that can rectify both images to be parallel.
- Given $F$, you can also compute the relative pose between cameras.
What if you have more than two views of the same scene?

This problem is called **structure-from-motion**

[Source: J. Hays]
Structure From Motion

- Solve a non-linear optimization problem minimizing re-projection error:

\[ E(P, X) = \sum_{i=1}^{\text{#cameras}} \sum_{j=1}^{\text{#points}} \text{dist}(x_{ij}, P_iX_j) \]

- This can be done via technique called **bundle adjustment**
