

# Intro to Image Understanding (CSC420)

## Assignment 3

Posted: March 5, 2024   Submission Deadline : March 14, 11.59pm, 2024

Instructions for submission: Please write a document (either pdf, doc, etc) with your solutions (include pictures where needed). Include your code inside the document.

Max points: 15

1. [5 points] Interest point detection:
  - (a) [4 points] Implement a function to perform Harris corner detection. The function should take as input an image, and return corners. You can make the image grayscale.
  - (b) [1 point] Plot your result for the attached image `building.jpg`, and add it to your pdf/doc file.
2. [10 points] For this exercise you will use the Scale-Invariant Feature Transform (SIFT) for matching. You will extract SIFT features from two images and use them to find feature correspondences and solve for the affine transformation between them. Please include code under each question. You are allowed to use external code for SIFT keypoint and descriptor extraction (**but not for matching**).
  - (a) [2 points] **Feature extraction:** Compute SIFT features for `reference.png`, `test.png`, and `test2.png`. You can use e.g. function `SIFT()` from existing packages to output, for each image, a list of feature descriptors and a list of their corresponding frames. Please visualize the detected keypoints on the image. By visualize we mean: plot the image, mark the center of each keypoint, and draw either a circle or rectangle to indicate the scale of each keypoint. For clarity, please plot only 100 keypoints. Please write the visualization function yourself – a function that loops over the extracted keypoints, and displays each keypoint on the image.
  - (b) [3 points] **Matching:** Given the extracted features on `reference.png` and `test.png`, describe a simple matching algorithm to find the best feature matches (correspondences) for the features in `reference.png` and features in image `test.png`. How did you define “best” matches? Implement the algorithm in your favorite programming language. Visualize the top (best) 3 correspondences. Please describe what you chose as a criteria to evaluate best matches. Please do the

same using the test image `test2.png`. Show each image and visualize each correspondence by indicating the feature's position and scale in the appropriate image. Use a separate color for each correspondence.

- (c) **[3 points] Affine transformation:** Use the top 3 correspondences from part (b) to solve for the affine transformation between the features in the two images.
- (d) **[2 points]** Visualize the affine transformation. Do this visualization by taking the four corners of the reference image, transforming them via the computed affine transformation to the points in the second image, and plotting those transformed points. Please also plot the edges between the points to indicate the parallelogram. If you are unsure what the instruction is, please look at Figure 12 of [Lowe, 2004].
