Section 5.3 defined and implemented the program \texttt{wait until} $w$ where $w$ is a time. Define and implement the program \texttt{wait until} $b$ where $b$ is a binary expression? For example, \texttt{wait until} $x=y$ should delay execution until variables $x$ and $y$ are equal. At least one variable in the expression should be an interactive variable belonging to another process.

After trying the question, scroll down to the solution.
wait until $c = \neg (\exists t'' \cdot t \leq t'' < t' \land c'') \land c'$ \parallel ok$

The independent composition with $ok$ says that all my variables other than time are unchanged. If I have any interactive variables, they are unchanged at all times from $t$ to $t'$.
