# Question 1. [10 MARKS]

For each of the statements below, indicate whether it is true or false by circling the corresponding word. You do NOT need to justify your answers.

**a.**  $15n^2 + 10n \in \mathcal{O}(n^3)$ 

- TRUE / FALSE
- **b.**  $5n^2 \log(n) + 10n \in \Omega(n^2)$
- TRUE / FALSE

c.  $n \log(n) + n \in \Theta(n)$ 

TRUE / FALSE

- **d.**  $\frac{1}{500}n 10\sqrt{n} \in \Omega(n)$
- TRUE / FALSE
- **e.**  $50n^2 \log(n) + 30n \in o(n^3)$
- TRUE / FALSE
- **f.**  $50n^2 \log(n) 30n \in o(51n^2 \log(n))$
- TRUE / FALSE
- g.  $15n^2 10n \in \Theta(20n^2)$
- TRUE / FALSE
- **h.**  $3\log^2(n) \log(n) \in \mathcal{O}(\log(n))$
- TRUE / FALSE
- i.  $\log(\sqrt{n}) \in \mathcal{O}(\sqrt{\log(n)})$
- TRUE / FALSE
- **j.**  $\log(n^2 \log(n)) \in \mathcal{O}(\log(n))$
- TRUE / FALSE

### Question 2. [10 MARKS]

Consider the function f(n) defined by

$$f(0) = 3,$$
  

$$f(1) = 0,$$
  

$$f(n) = 2f(n-2) + n^{2}, \text{ for } n \ge 2.$$
(1)

For example, f(2) = 10, f(3) = 9, and f(4) = 36. Prove that f(n+1) > f(n) for all integers  $n \ge 3$ .

**Proof.** Let S(n) be the statement "f(n+1) > f(n)". We will use complete induction to prove that S(n) is true for all  $n \ge 3$ .

**Base Case.** Equation 1 implies that f(2) = 10, f(3) = 9, f(4) = 36, and f(5) = 43. Therefore f(4) > f(3) and f(5) > f(4). And so f(5) > f(4) are true.

Let  $k \geq 5$  be an arbitrary integer.

Induction Hypothesis. Suppose S(j) is true for  $3 \le j < k$ .

**Induction Step.** We need to prove S(k) is true. Since  $k \geq 5$  we have  $k > k - 2 \geq 3$  and, by the induction hypothesis, S(k-2) must be true. Therefore f(k-1) > f(k-2). We use this fact below.

Using equation (1) we find,

$$f(k+1) = 2f(k+1-2) + (k+1)^2$$
, by equation (1), since  $k+1 \ge 2$ ,  
  $> 2f(k-1) + k^2$ , since  $(k+1)^2 > k^2$ ,  
  $> 2f(k-2) + k^2$ , since we showed above that  $f(k-1) > f(k-2)$ ,  
  $= f(k)$ , by equation (1), since  $k \ge 2$ .

Therefore f(k+1) > f(k) and so S(k) is true.

By mathematical induction it follows that S(n) is true for all n > 3.

### Question 3. [10 MARKS]

Use an appropriate loop invariant to prove that the following program is correct.

```
IntLog(x, b)
Precondition: x, b are integers such that x \ge 1, b \ge 2.
Postcondition: Returns the integer k such that b^k \leq x < b^{k+1}.
1
      k := 0
2
      n := 1
3
      while n*b \leq x do
4
          k := k + 1
5
          n := n * b
6
      end while
7
      return k
```

**Proof.** Define L(i) to be the loop invariant: "If exactly *i* iterations have been completed, then  $k_i = i$  and  $n_i = b^i \le x$ ." We will use induction to prove that L(i) is true for all  $i \in \mathbb{N}$ .

**Base Case:** By lines 1 and 2 of the program, we find  $k_0 = 0$  and  $n_0 = 1$ . Since b > 0 we have  $b^0 = 1$ . By the precondition  $x \ge 1$ , so we have  $n_0 = b^0 = 1 \le x$ . Hence L(0) is true.

Let i be an arbitary natural number.

Induction Hypothesis. Suppose L(i) is true.

Induction Step. We need to prove L(i+1) is true. If the loop exits before iteration (i+1), then L(i+1) is trivially true. Otherwise, when the loop body begins execution for the  $(i+1)^{st}$  time then, from the induction hypothesis L(i), we have  $k_i = i$  and  $n_i = b^i \le x$ . Moreover, the loop condition must be satisfied to allow iteration i+1, so  $n_i b \le x$ . By lines 4 and 5 we then have  $k_{i+1} = k_i + 1 = i + 1$  and  $n_{i+1} = n_i b = b^{i+1}$ . Finally, since we know from the loop condition that  $n_i b \le x$ , we find that  $n_{i+1} = n_i b \le x$ . This proves that L(i+1) is true.

Therefore we conclude that L(i) is true for all  $i \in \mathbb{N}$ .

**Partial Correctness.** If the program terminates immediately after iteration i then, from the loop invariant L(i), we have  $k_i = i$  and  $n_i = b^i \le x$ . Moreover, the loop condition  $n_i b \le x$  must fail to hold, and therefore  $n_i b > x$ . It follows that  $n_i = b^{k_i} \le x < b^{k_i+1}$  Therefore  $k = k_i$  satisfies the postcondition upon termination.

**Termination.** Consider the sequence  $\langle s_0, s_1, \ldots \rangle$  where  $s_i$  is defined only if the loop completes at least i iterations, in which case  $s_i = x - n_i$ . By the precondition and the loop invariant L(i), each of x, b, and  $n_i = b^i$  are integers with  $n_i \leq x$ . Therefore  $s_i = x - n_i \geq 0$  is a natural number. Moreover, if  $s_i$  and  $s_{i+1}$  exist, then

```
s_{i+1} = x - n_{i+1} = x - n_i b, by the loop invariant L(i+1),

< x - n_i, since 1 < b and 0 < n_i = b^i together imply n_i < n_i b,

= s_i.
```

Therefore  $\langle s_0, s_1, \ldots \rangle$  is a decreasing sequence of natural numbers. Therefore it must be a finite sequence. Therefore the program must terminate.
