

# **Bit Vectors**

**(bit arrays)**

**(bit strings)**

King: 20.1, 20.2

# Bit strings

- Signal mask and file descriptor sets are implemented using bit arrays or bit strings.
- You should always use the supplied functions macros to manipulate these structures.
- It is useful to know how they are implemented.
- Each bit represents an element of the set
  - 1 == in the set
  - 0 == not in the set

# Bitwise operators

- shift (note that bits fall off the ends)

<< left shift

>> right shift

```
i = 6;          /* 0000 0000 0000 0110 */  
j = i << 2; /* 0000 0000 0001 1000 */  
k = i >> 2; /* 0000 0000 0000 0001 */
```

to set bit at index 10 (start indexing at 0):

```
j = 10;  
i = 1 << j; /* 0000 0100 0000 0000 */
```

# Bitwise Complement, And, Or, Xor

- `~ complement`

- `& and`

- `^ xor`

	<code>i = 17;</code>	<code>/* 0001 0001 */</code>
	<code>j = 3;</code>	<code>/* 0000 0011 */</code>
• <code>  or</code>	<code>k = ~j;</code>	<code>/* 1111 1100 */</code>

	<code>m = i &amp; j;</code>	<code>/* 0000 0001 */</code>
	<code>n = i   j;</code>	<code>/* 0001 0011 */</code>
	<code>o = i ^ j;</code>	<code>/* 0001 0010 */</code>

# Idioms

- Setting a bit string to all 1s:  
– `i = ~0;` or `i = -1;`
- Set all but the last 2 bits to 1:  
– `i = ~0x3;`
- Setting bit j:  
– `x = 1 << j;`  
or  
– `x = 0;`  
– `x |= 1 << j;`

# Watch out!

- `i = 2; /* 0000 0010 */`
- `j = 1; /* 0000 0001 */`
- `if (i & j)`
  - `printf("i and j = %d\n", i & j);`
- `if (i && j)`
  - `printf("i and j both true -- %d\n", i && j)`

# Arrays of bit strings

- FD\_SETSIZE is bigger than 32.

```
struct bits {  
    unsigned int field[N];  
};  
typedef struct bits Bitstring;  
Bitstring a, b;  
setzero(&a);  
b = a;  
a.field[0] = ~0;
```

# Setting and Unsetting

```
int set(unsigned int bit, Bitstring *b) {  
    int index = bit / 32;  
    b->field[index] |= 1 << (bit % 32);  
    return 1;  
}
```

```
int unset(unsigned int bit, Bitstring *b) {  
    int index = bit / 32;  
    b->field[index] &= ~(1 << (bit % 32));  
}
```

# Testing and emptying

```
int ifset(unsigned int bit, Bitstring *b) {  
    int index = bit / 32;  
    return ( (1 << (bit % 32))  
            & b->field[index]);  
}  
  
void setzero(Bitstring *b) {  
    memset(b, 0, sizeof(Bitstring));  
}
```

# Printing

```
char *IntToBinary(unsigned int number) {  
    char *binaryString = malloc(32+1);  
    int i;  
    binaryString[32] = '\0';  
    for (i = 31; i >= 0; i--) {  
        binaryString[i] = ((number & 1) + '0');  
        number = number >> 1;  
    }  
    return binaryString;  
}
```
