

# I/O Multiplexing

Haviland 7.1.6

# The problem

- When reading from multiple sources, blocking on one of the sources could be bad.
  - An example of denial of service.
- One solution: one process for every client. What are the pros and cons of this solution?

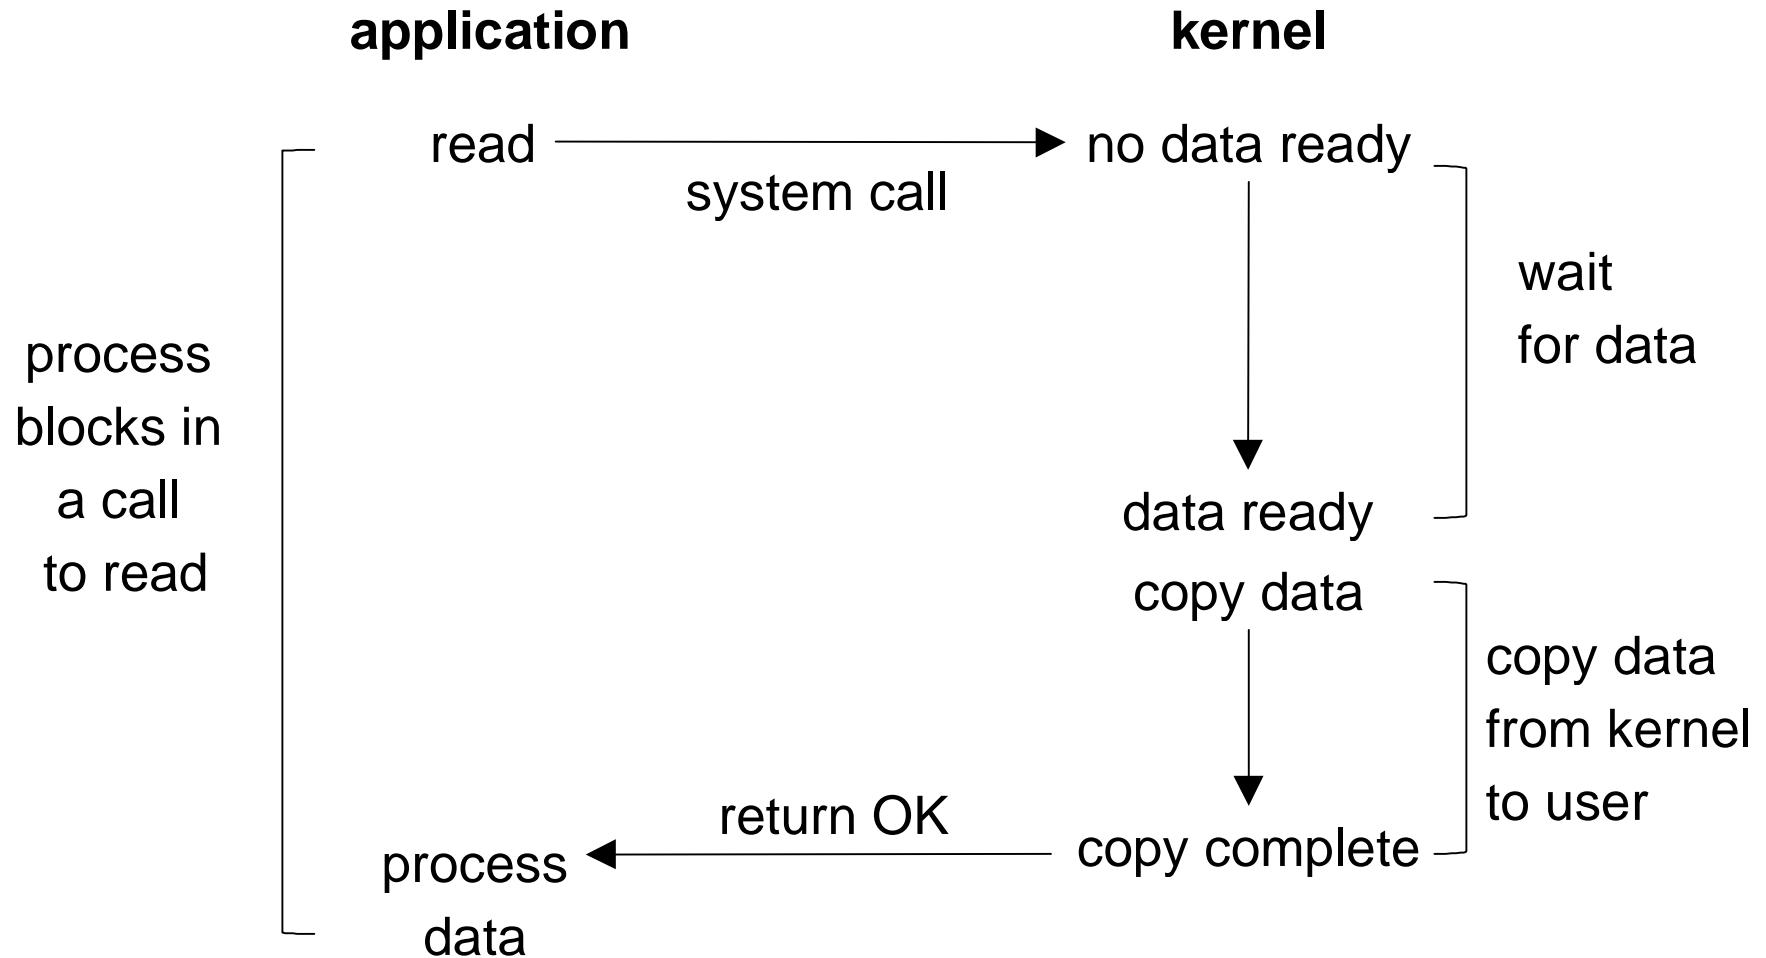

# Another way to look at the problem

## Server

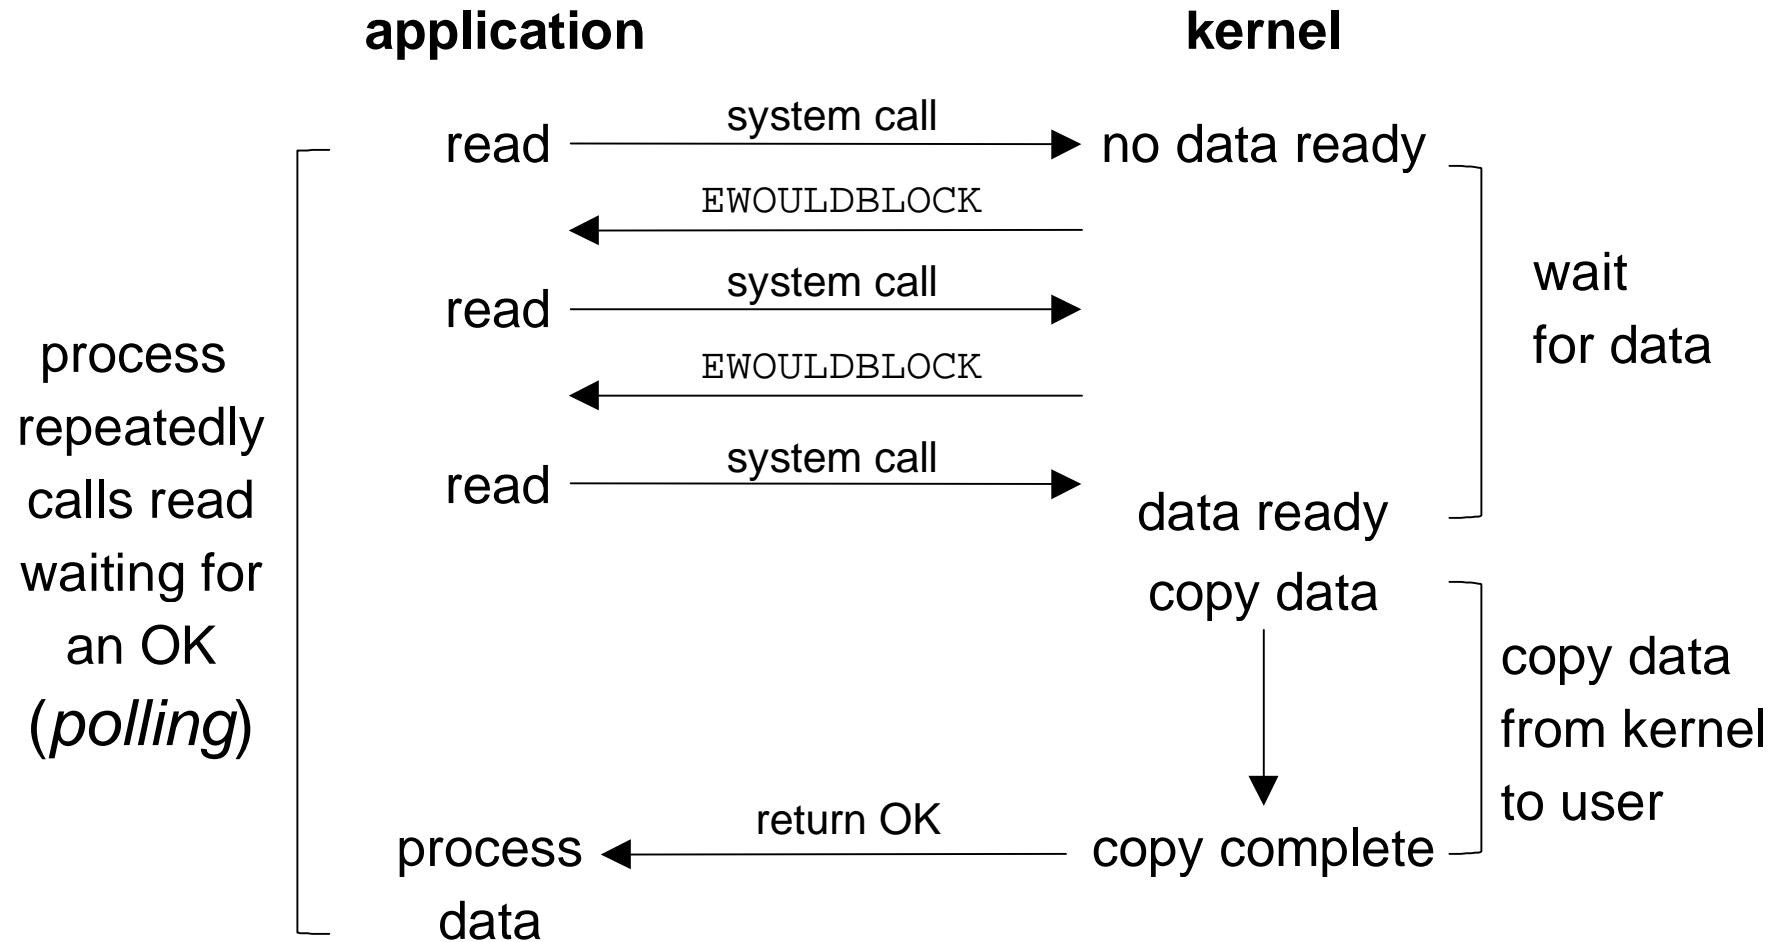

```
while(1)
    accept a new connection
    for each existing connection
        read
        write
```

- Which of the system calls might block indefinitely?
  - read and accept
- So what happens if there is only one connection?

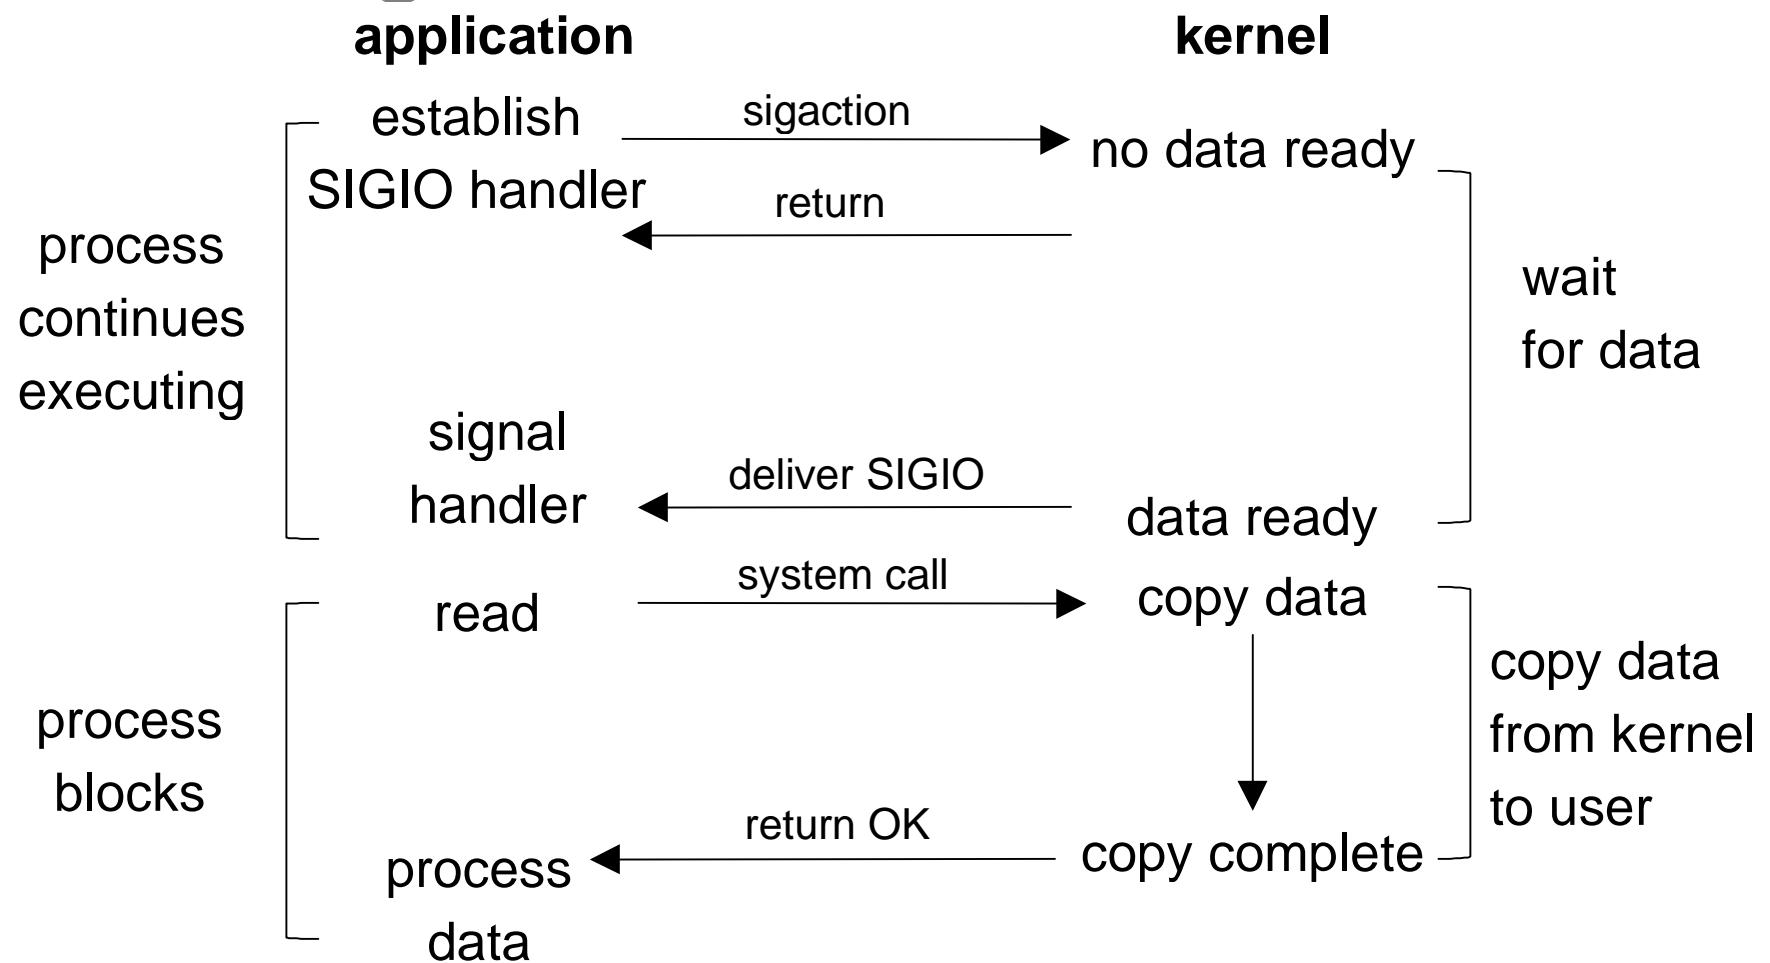

# Blocking I/O Model

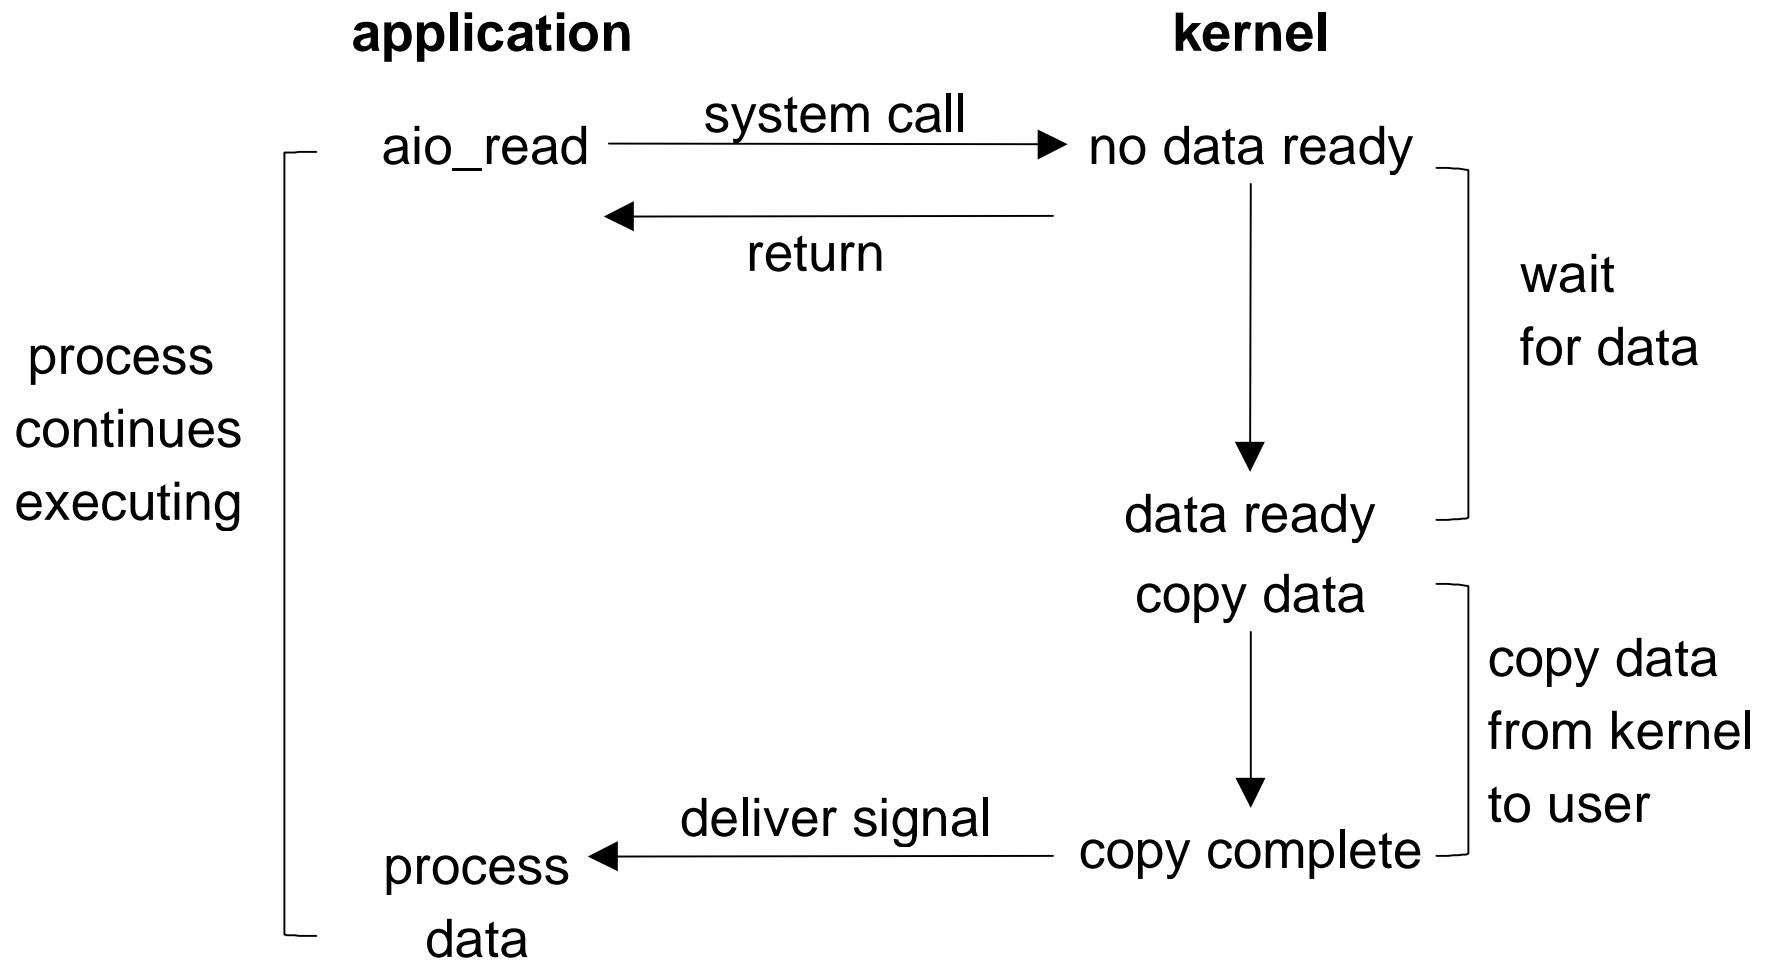

# Nonblocking I/O Model

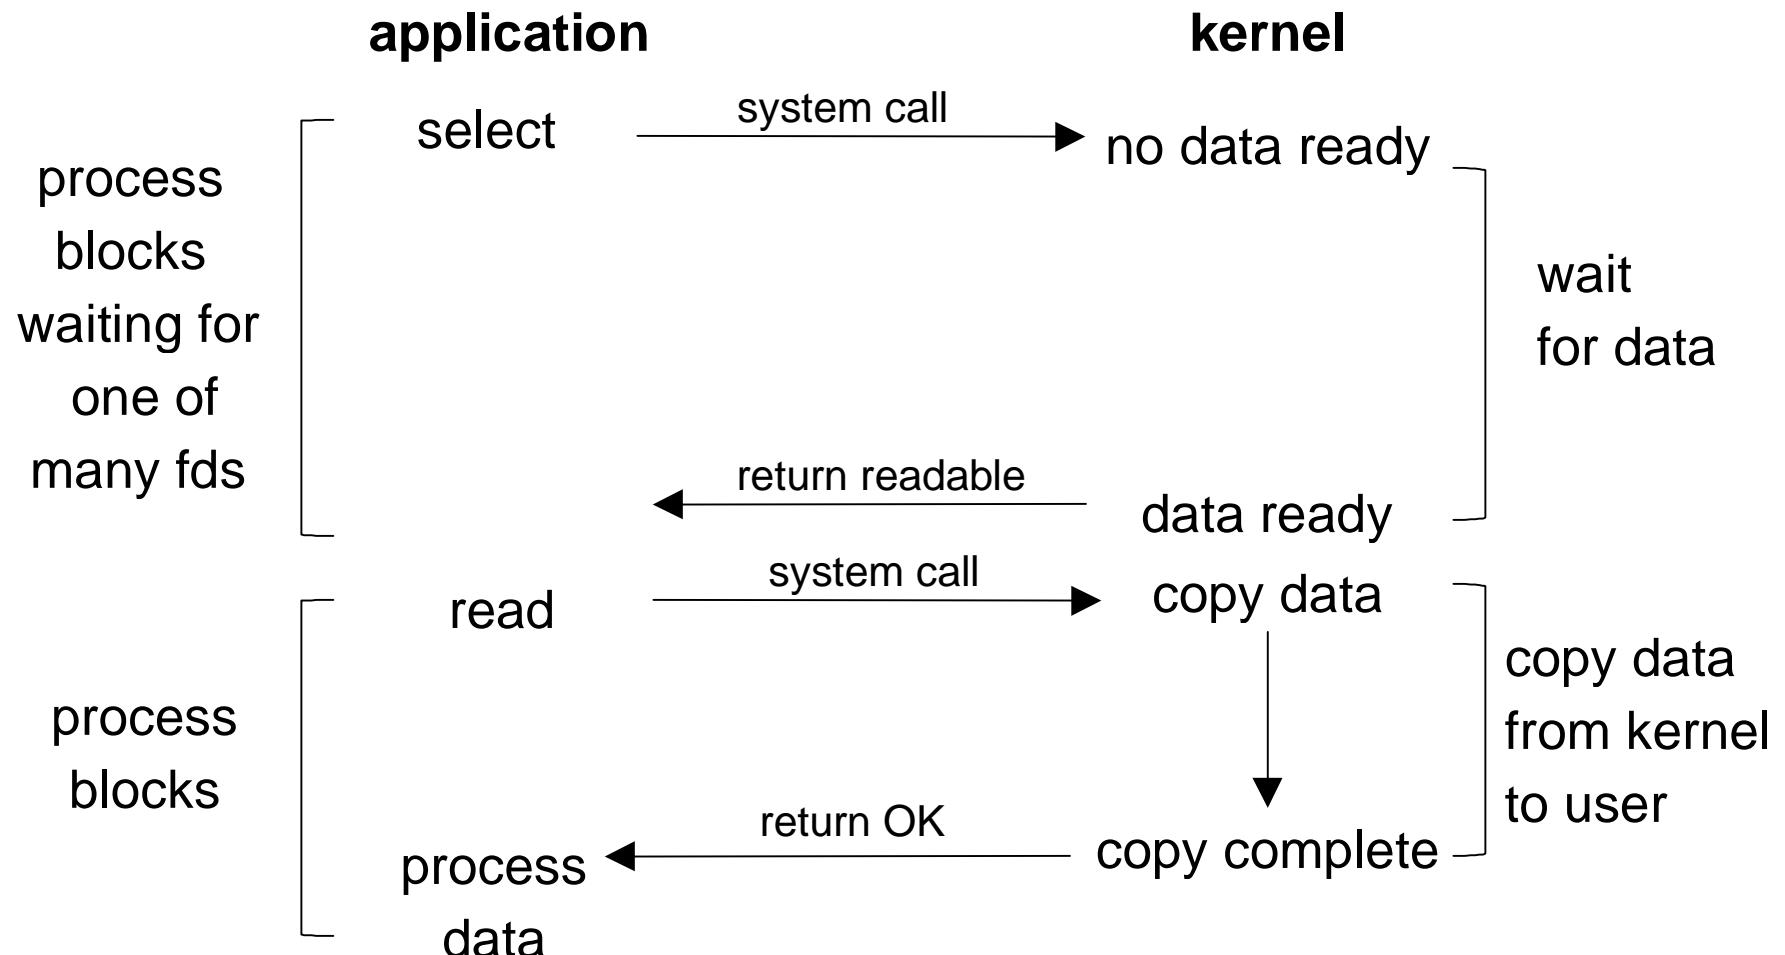

# Signal Driven I/O Model

# Asynchronous I/O Model

# I/O Multiplexing Model

# select( )

```
int select(int maxfdp1,  
          fd_set *readset,  
          fd_set *writeset,  
          fd_set *exceptset,  
          const struct timeval *timeout);
```

- A call to `select` returns when one of the file descriptors in one of the sets is ready for I/O.
- If `timeout` is not `NULL`, then `select` returns when a descriptor is ready or `timeout` time has passed.
- If `timeout` is 0, `select` returns immediately after checking descriptors.

# Readiness

- Ready to read when
  - there is data in the receive buffer to be read
  - end-of-file state on file descriptor
  - the socket is a listening socket and there is a connection pending
  - a socket error is pending
- Ready to write when
  - there is space available in the write buffer
  - a socket error is pending
- Exception condition pending when
  - TCP out-of-band data
- We are typically interested in when bytes are available to be read, but sometimes we use select on write or exception sets

# select timeout

- The timeout specifies how long we're willing to wait for a fd to become ready

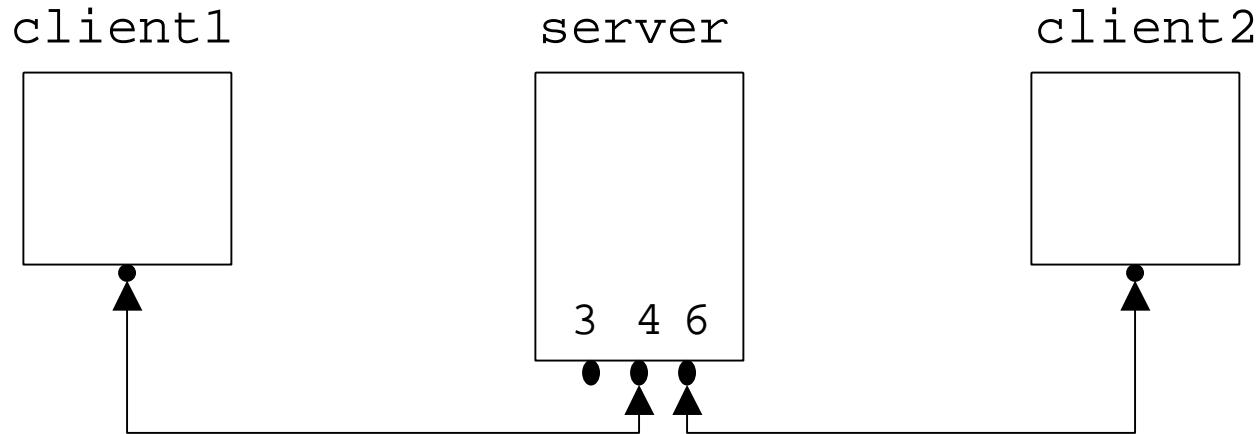

```
struct timeval {  
    long   tv_sec;          /* seconds */  
    long   tv_usec;         /* microseconds */  
};
```

- If timeout is NULL, wait forever (or until we catch a signal)
  - If timeout is zero, test and return immediately
  - Otherwise wait up to specified timeout
- select returns when a fd ready or we timeout

# Descriptor sets

- Typically implemented as an array of integers where each bit corresponds to a descriptor (except in Windows).
- Implementation is hidden in the `fd_set` data type
- `FD_SETSIZE` is the number of descriptors in the data type
- `maxfdp1` specifies the number of descriptors to test
- Macros:
  - `void FD_ZERO(fd_set *fdset);`
  - `void FD_SET(int fd, fd_set *fdset);`
  - `void FD_CLR(int fd, fd_set *fdset);`
  - `int FD_ISSET(int fd, fd_set *fdset);`

# Descriptor sets

fd0 fd1 fd2 fd3 fd4 fd5 fd6

allset	0	0	0	1	1	0	1	
	maxfd + 1 = 7							

After select:

rset	0	0	0	1	0	0	0	
------	---	---	---	---	---	---	---	--

# select example

```
fd_set rfds;
struct timeval tv;
int retval;

FD_ZERO(&rfds); /* Watch stdin (fd 0) for input */
FD_SET(STDIN_FILENO, &rfds);
tv.tv_sec = 5; /* Wait up to five seconds. */
tv.tv_usec = 0;
retval = select(1, &rfds, NULL, NULL, &tv);
if (retval == -1)
    perror("select()");
else if (retval > 0)
    printf("Data is available now.\n");
    /* FD_ISSET(0, &rfds) will be true, can use read() */
else
    printf("No data within five seconds.\n");
```

```

for( ; ; ) {
    rset = allset;
    nready = Select(maxfd+1, &rset ,NULL,NULL,NULL);
    if(FD_ISSET(listenfd, &rset)) {
        connfd = Accept(listenfd, &caddr, &clen);
        for(i = 0; i < FD_SETSIZE; i++)
            if(client[i] < 0) {
                client[i] = connfd; break;
            }
        FD_SET(connfd, &allset);
        if(connfd > maxfd) maxfd = connfd;
    }
    for(i = 0; i <= maxi; i++) {
        if(sockfd = client[i]) < 0) continue;
        if(FD_ISSET(sockfd, &rset))
            Read(sockfd, line, MAXLINE);
    }
}
}

```

```

for( ; ; ) {
    rset = allset;
    nready = Select(maxfd+1, &rset ,NULL,NULL,NULL);
    if(FD_ISSET(listenfd, &rset)) {
        connfd = Accept(listenfd, &caddr, &clen);
        for(i = 0; i < FD_SETSIZE; i++)
