Review: Memory Latency Lags Behind

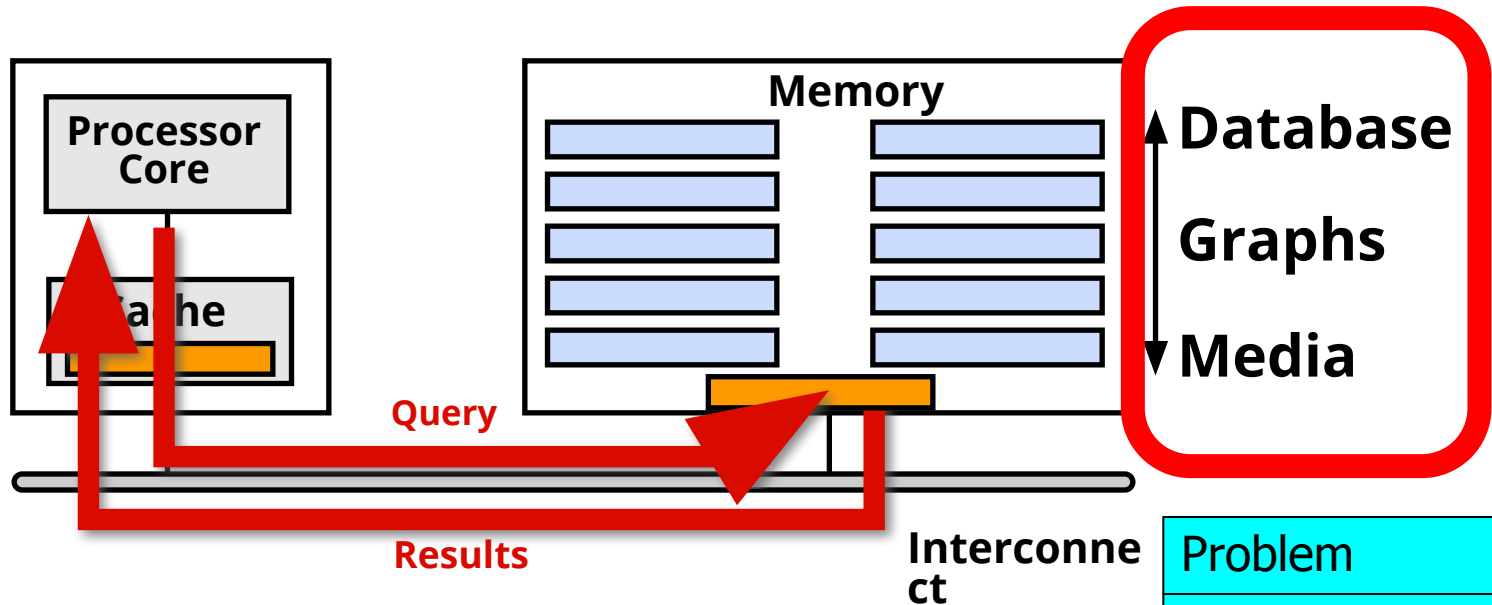

Memory latency remains almost constant

We Need A Paradigm Shift To ...

- Enable computation with minimal data movement
- Compute where it makes sense (where data resides)
- Make computing architectures more data-centric

Processing Inside Memory

- Many questions ... How do we design the:
 - ❑ compute-capable memory & controllers?
 - ❑ processor chip?
 - ❑ software and hardware interfaces?
 - ❑ system software and languages?
 - ❑ algorithms?

Why In-Memory Computation Today?

- **Pull from Systems and Applications**
 - ❑ Data access is a major system and application bottleneck
 - ❑ Systems are energy limited
 - ❑ Data movement much more energy-hungry than computation

Two Approaches to In-Memory Processing

- 1. Minimally change DRAM to enable simple yet powerful computation primitives
 - RowClone: Fast and Efficient In-DRAM Copy and Initialization of Bulk Data (Seshadri et al., MICRO 2013)
 - Fast Bulk Bitwise AND and OR in DRAM (Seshadri et al., IEEE CAL 2015)
 - Gather-Scatter DRAM: In-DRAM Address Translation to Improve the Spatial Locality of Non-unit Strided Accesses (Seshadri et al., MICRO 2015)
- 2. Exploit the control logic in 3D-stacked memory to enable more comprehensive computation near memory
 - PIM-Enabled Instructions: A Low-Overhead, Locality-Aware Processing-in-Memory Architecture (Ahn et al., ISCA 2015)
 - A Scalable Processing-in-Memory Accelerator for Parallel Graph Processing (Ahn et al., ISCA 2015)
 - Accelerating Pointer Chasing in 3D-Stacked Memory: Challenges, Mechanisms, Evaluation (Hsieh et al., ICCD 2016)

Approach 1: Minimally Changing DRAM

- DRAM has great capability to perform **bulk data movement and computation** internally with small changes
 - Can exploit internal bandwidth to move data
 - Can exploit analog computation capability
 - ...
- Examples: RowClone, In-DRAM AND/OR, Gather/Scatter DRAM
 - RowClone: Fast and Efficient In-DRAM Copy and Initialization of Bulk Data (Seshadri et al., MICRO 2013)
 - Fast Bulk Bitwise AND and OR in DRAM (Seshadri et al., IEEE CAL 2015)
 - Gather-Scatter DRAM: In-DRAM Address Translation to Improve the Spatial Locality of Non-unit Strided Accesses (Seshadri et al., MICRO 2015)

Executive Summary

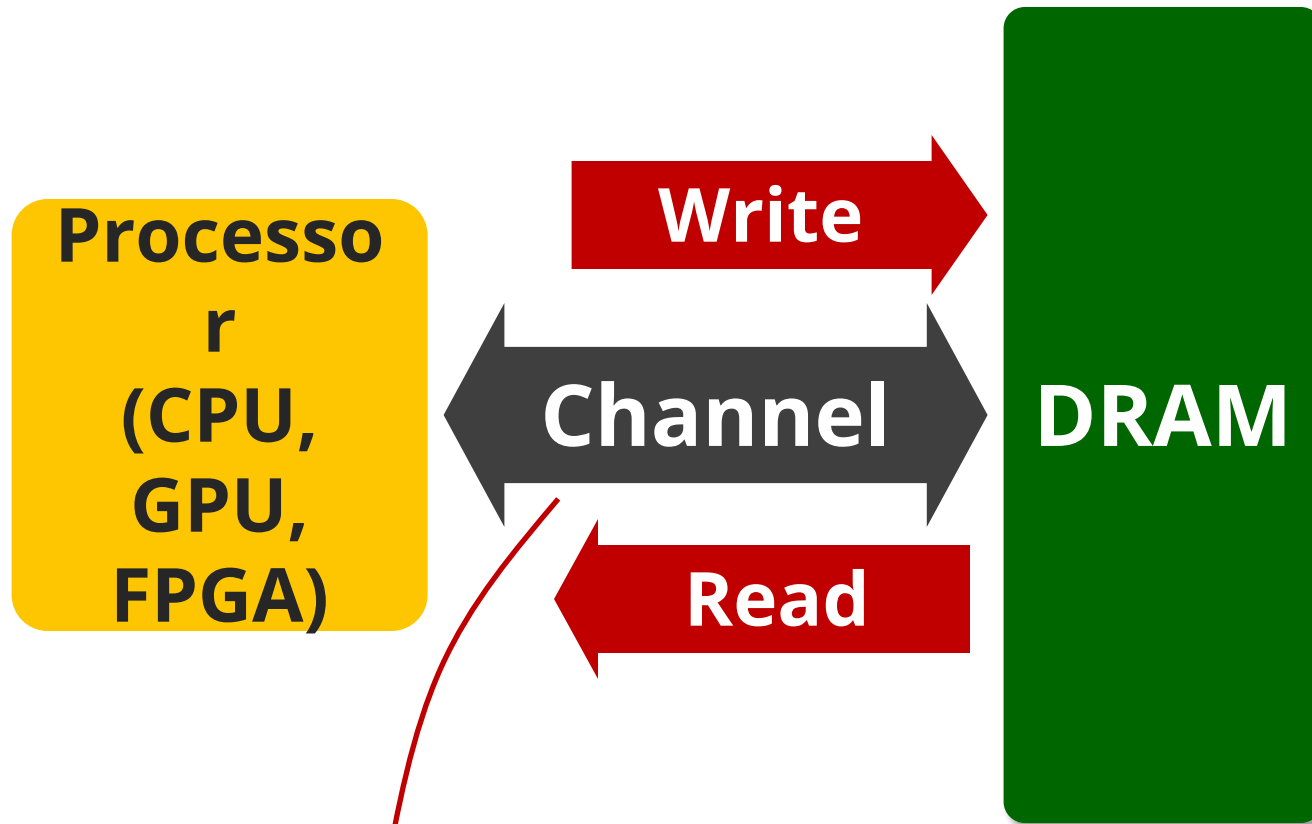

- **Problem: Bulk bitwise operations**
 - present in many applications, e.g., databases, search filters
 - existing systems are memory bandwidth limited
- **Our Proposal: Ambit**
 - perform bulk bitwise operations **completely inside DRAM**
 - **bulk bitwise AND/OR**: simultaneous activation of three rows
 - **bulk bitwise NOT**: inverters already in sense amplifiers
 - less than 1% area overhead over existing DRAM chips
- **Results compared to state-of-the-art baseline**
 - average across seven bulk bitwise operations
 - 32X performance improvement, 35X energy reduction
 - 3X-7X performance for real-world data-intensive applications

Bulk Bitwise AND/OR in DRAM

Statically reserve three designated rows **t1**, **t2**, and **t3**

Result = row A

1. **AND/OR** row **B** of row **A** to row **t1**
Copy data of row **A** to row **t1**
2. **Copy RowClone** data of row **B** to row **t2**
Copy data of row **B** to row **t2**
3. **Initialize RowClone** data of row **t3** to 0/1
Initialize data of row **t3** to 0/1
4. **Activate** rows **t1/t2/t3** simultaneously
Activate rows **t1/t2/t3** simultaneously
5. **Copy RowClone** data of row **t1/t2/t3** to **Result** row
Copy data of row **t1/t2/t3** to **Result** row

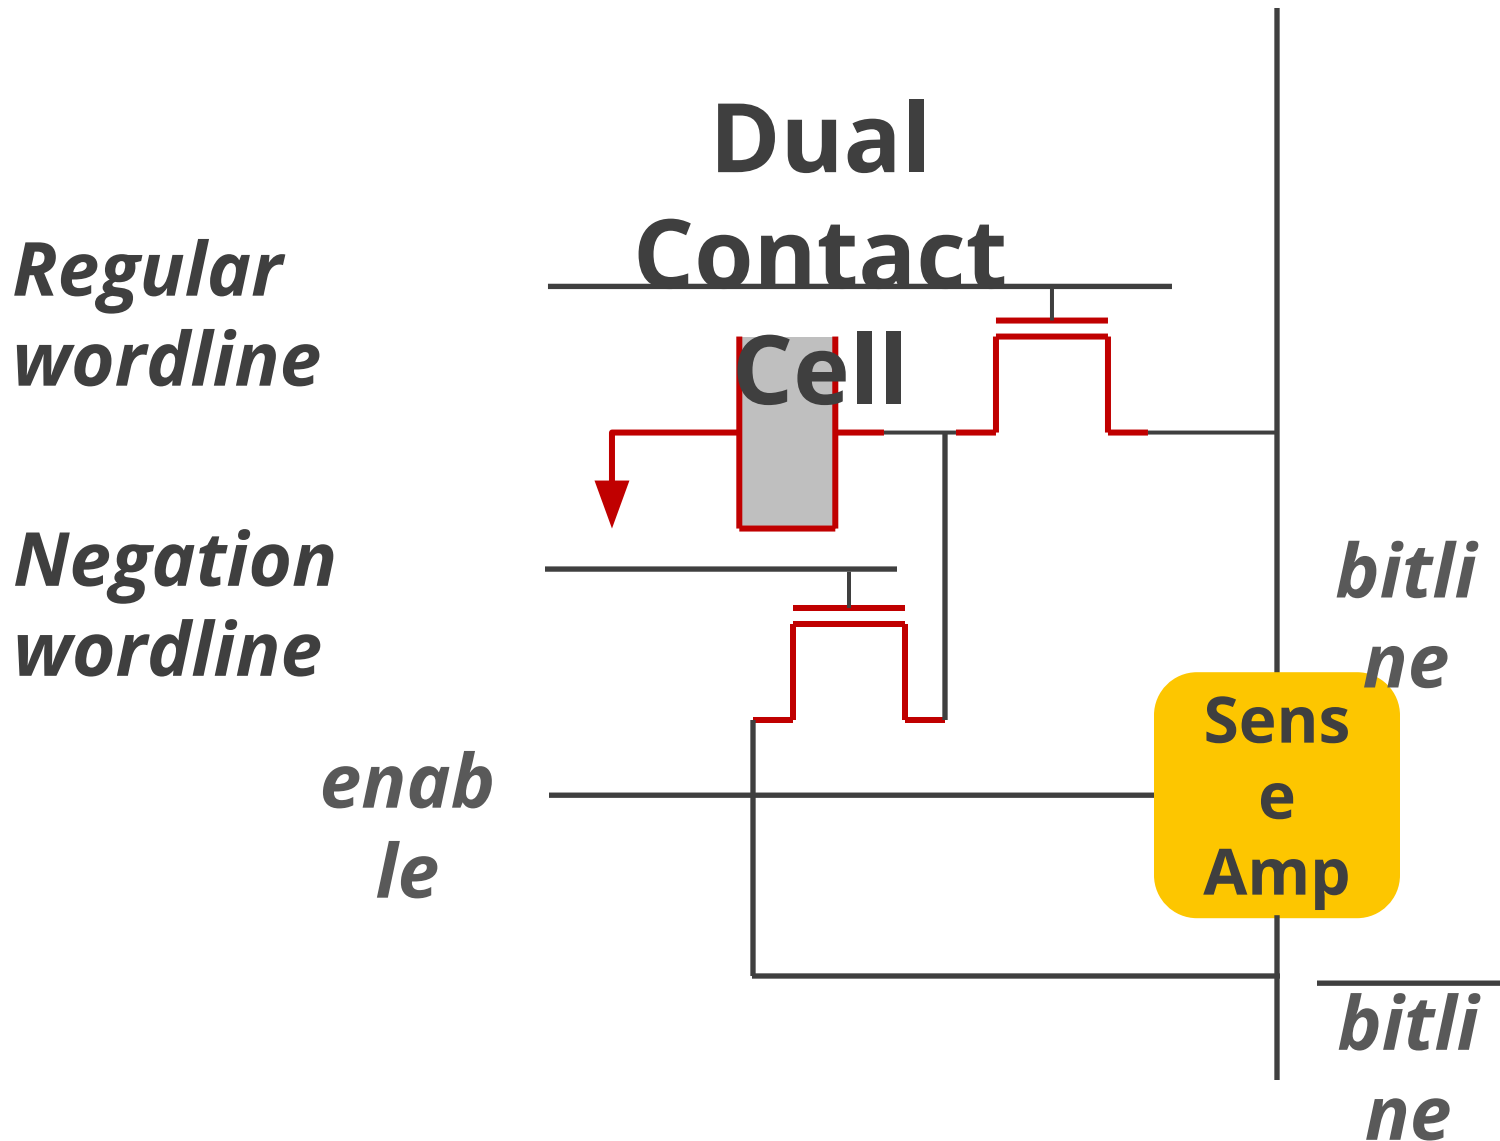

Use **RowClone** to perform **copy** and **initialization** operations completely in **DRAM!**

Emerging Memory Technologies

Limits of Charge Memory

- Difficult charge placement and control
 - Flash: floating gate charge
 - DRAM: capacitor charge, transistor leakage
- **Reliable sensing becomes difficult as charge storage unit size reduces**

Charge vs. Resistive Memories

- Charge Memory (e.g., DRAM, Flash)
 - Write data by capturing charge Q
 - Read data by detecting voltage V

- Resistive Memory (e.g., PCM, STT-MRAM, memristors)
 - Write data by pulsing current dQ/dt
 - Read data by detecting resistance R

Promising Resistive Memory Technologies

■ PCM

- Inject current to change **material phase**
- Resistance determined by phase

■ STT-MRAM

- Inject current to change **magnet polarity**
- Resistance determined by polarity

■ Memristors/RRAM/ReRAM

- Inject current to change **atomic structure**
- Resistance determined by atom distance

What is Phase Change Memory?

- Phase change material (chalcogenide glass) exists in two states:
 - Amorphous: Low optical reflexivity and high electrical resistivity
 - Crystalline: High optical reflexivity and low electrical resistivity

PCM is resistive memory: High resistance (0), Low resistance (1)
PCM cell can be switched between states reliably and quickly

How Does PCM Work?

- Write: change phase via current injection
 - SET: sustained current to heat cell above T_{cryst}
 - RESET: cell heated above T_{melt} and quenched
- Read: detect phase via material resistance
 - amorphous/crystalline

Opportunity: PCM Advantages

- **Scales better than DRAM, Flash**
 - Requires current pulses, which scale linearly with feature size
 - Expected to scale to 9nm (2022 [ITRS])
 - Prototyped at 20nm (Raoux+, IBM JRD 2008)
- **Can be denser than DRAM**
 - Can store multiple bits per cell due to large resistance range
 - Prototypes with 2 bits/cell in ISSCC'08, 4 bits/cell by 2012
- **Non-volatile**
 - Retain data for >10 years at 85C
- **No refresh needed, low idle power**

PCM Resistance \rightarrow Value

Multi-Level Cell PCM

- Multi-level cell: more than 1 bit per cell
 - Further increases density by 2 to 4x [Lee+,ISCA'09]
- But MLC-PCM also has drawbacks
 - Higher latency and energy than single-level cell PCM

MLC-PCM Resistance → Value

MLC-PCM Resistance → Value

Less margin between values

→ need more precise sensing/modification of cell contents

→ higher latency/energy (~2x for reads and 4x for writes)

Phase Change Memory Properties

- Surveyed prototypes from 2003-2008 (ITRS, IEDM, VLSI, ISSCC)
- Derived PCM parameters for $F=90\text{nm}$

- Lee, Ipek, Mutlu, Burger, "Architecting Phase Change Memory as a Scalable DRAM Alternative," ISCA 2009.
- Lee et al., "Phase Change Technology and the Future of Main Memory," IEEE Micro Top Picks 2010.

Phase Change Memory Properties: Latency

- Latency comparable to, but slower than DRAM

Typical Access Latency (in terms of processor cycles for a 4 GHz processor)

- Read Latency
 - 50ns: 4x DRAM, 10^{-3} x NAND Flash
- Write Latency
 - 150ns: 12x DRAM
- Write Bandwidth
 - 5-10 MB/s: 0.1x DRAM, 1x NAND Flash

Phase Change Memory Properties

- Dynamic Energy

- 40 uA Rd, 150 uA Wr
- 2-43x DRAM, 1x NAND Flash

- Endurance

- Writes induce phase change at 650C
- Contacts degrade from thermal expansion/contraction
- 10^8 writes per cell
- 10^{-6} x DRAM, 10^3 x NAND Flash

- Cell Size

- 9-12F² using BJT, single-level cells
- 1.5x DRAM, 2-3x NAND (will scale with feature size, MLC)

Phase Change Memory: Pros and Cons

- Pros over DRAM
 - Better technology scaling (capacity and cost)
 - Non volatile □ Persistent
 - Low idle power (no refresh)
- Cons
 - Higher latencies: $\sim 4\text{-}15\times$ DRAM (especially write)
 - Higher active energy: $\sim 2\text{-}50\times$ DRAM (especially write)
 - Lower endurance (a cell dies after $\sim 10^8$ writes)
 - Reliability issues (resistance drift)
- Challenges in enabling PCM as DRAM replacement/helper:
 - Mitigate PCM shortcomings
 - Find the right way to place PCM in the system

PCM-based Main Memory (I)

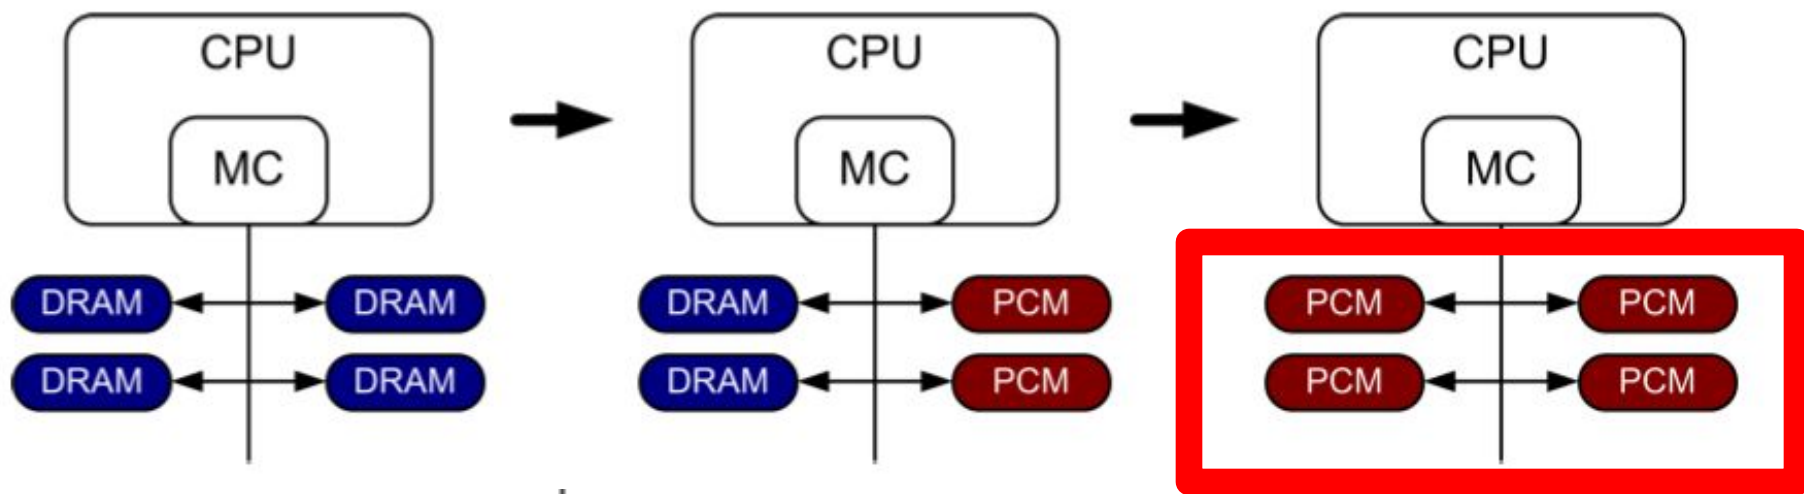

- How should PCM-based (main) memory be organized?

- **Hybrid PCM+DRAM** [Qureshi+ ISCA'09, Dhiman+ DAC'09]:
 - How to partition/migrate data between PCM and DRAM

PCM-based Main Memory (II)

- How should PCM-based (main) memory be organized?

- **Pure PCM main memory** [Lee et al., ISCA'09, Top Picks'10]:
 - How to redesign entire hierarchy (and cores) to overcome PCM shortcomings

An Initial Study: Replace DRAM with PCM

- Lee, Ipek, Mutlu, Burger, "Architecting Phase Change Memory as a Scalable DRAM Alternative," ISCA 2009.
 - Surveyed prototypes from 2003-2008 (e.g. IEDM, VLSI, ISSCC)
 - Derived "average" PCM parameters for F=90nm

Density

- ▷ 9 - 12F² using BJT
- ▷ 1.5× DRAM

Latency

- ▷ 50ns Rd, 150ns Wr
- ▷ 4×, 12× DRAM

Endurance

- ▷ 1E+08 writes
- ▷ 1E-08× DRAM

Energy

- ▷ 40μA Rd, 150μA Wr
- ▷ 2×, 43× DRAM

Results: Naive Replacement of DRAM with PCM

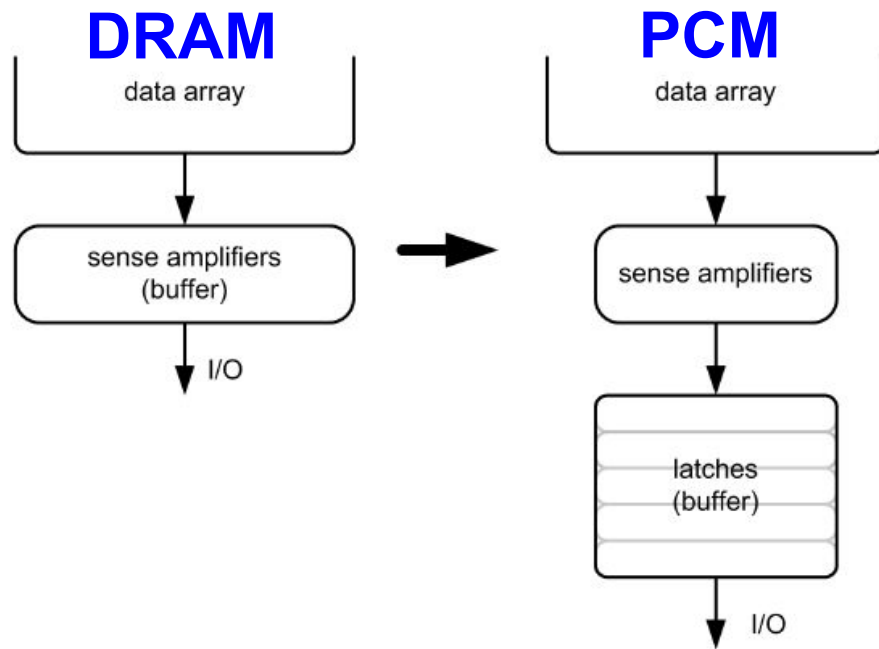

- Replace DRAM with PCM in a 4-core, 4MB L2 system
- PCM organized the same as DRAM: row buffers, banks, peripherals
- 1.6x delay, 2.2x energy, 500-hour average lifetime

- Lee, Ipek, Mutlu, Burger, "Architecting Phase Change Memory as a Scalable DRAM Alternative," ISCA 2009.

Architecting PCM to Mitigate Shortcomings

- Idea 1: Use multiple narrow row buffers in each PCM chip
 - Reduces array reads/writes
 - better endurance, latency, energy
- Idea 2: Write into array at cache block or word granularity
 - Reduces unnecessary wear

Results: Architected PCM as Main Memory

- 1.2x delay, 1.0x energy, 5.6-year average lifetime
- Scaling improves energy, endurance, density

- Caveat 1: Worst-case lifetime is much shorter (no guarantees)
- Caveat 2: Intensive applications see large performance and energy hits
- Caveat 3: Optimistic PCM parameters?
