

CSC 108H1 S 2012 Test 1  
Duration — 45 minutes  
Aids allowed: none

Student Number: \_\_\_\_\_

Last Name: \_\_\_\_\_ First Name: \_\_\_\_\_

Lecture Section: L0101

Instructor: Campbell

---

*Do **not** turn this page until you have received the signal to start.*  
(Please fill out the identification section above, **write your name on the back of the test**, and read the instructions below.)  
*Good Luck!*

---

This midterm consists of 4 questions on 6 pages (including this one). *When you receive the signal to start, please make sure that your copy is complete.* Comments and docstrings are not required except where indicated, although they may help us mark your answers. They may also get you part marks if you can't figure out how to write the code. No error checking is required: assume all user input and all argument values are valid. If you use any space for rough work, indicate clearly what you want marked.

**Question 1.** [2 MARKS]**Part (a)** [1 MARK] What is the output of the following?

```
pic = media.create_picture(50, 100)
pic2 = media.add_text(pic, 0, 0, 'test', media.yellow)
print type(pic2)
```

**Part (b)** [1 MARK] Rewrite the following code without an if-statement.

```
if ketchup and not mustard:
    return True
else:
    return False
```

**Question 2.** [2 MARKS]

In each question below, fill in the box with python code that will make the program behaviour match the comments. You may **not** make any other changes to the code.

**Part (a)** [1 MARK]

```
name = 'Matthew'
age = 3
```

# Print the following: Matthew is 3!

print  % (name, age)**Part (b)** [1 MARK]

```
pic = media.load_picture(media.choose_file())
```

# get the pixel at (10, 4)

```
# set the pixel at (10, 4) to yellow
media.set_color(pix, media.yellow)
```

**Question 3.** [8 MARKS]

**Part (a)** [4 MARKS] Complete the following function according to its docstring description.

```
def change_green(pic, factor):  
    '''(Picture, float) -> Picture  
    Return a new picture that is a copy of pic, but with each pixel's green color  
    component set to its original value multiplied by factor. factor is a value  
    between 0.0 and 1.0, inclusive.'''
```

**Part (b)** [4 MARKS]

Write a main block that allows the user to choose a file, prompts the user with, 'Enter a value between 0.0 and 1.0, inclusive: ', applies the `change_green` function from part (a) to the picture in that file using the value entered by the user, and displays the resulting picture. You may assume that the user chooses a valid picture file and enters a valid value.

```
if __name__ == '__main__':
```

**Question 4.** [8 MARKS]

Consider the following two .py files, which are saved in the same directory (folder).

module\_a.py:

```
def f(s):
    result = ''

    for char in s:
        if char == char.upper():
            result = result + char

    return result

if __name__ == '__main__':
    print f('EFg')

# this code is not inside the
# body of the if-statement
print f('aBcde')
```

module\_b.py:

```
import module_a

def g(s):
    answer = module_a.f(s)
    return len(answer)

if __name__ == '__main__':
    print module_a.f('WXYZ')
    print g('TeSTiNg')
```

This question continues on the next page. You may use the space below for rough work.

**Part (a)** [1 MARK]

How many lines of output are produced when `module_b` is executed (by clicking Run)?

Circle one:                    2 lines                    3 lines                    4 lines

**Part (b)** [4 MARKS]

In the table below, show the output from running `module_b`. If there are fewer than four lines of output, leave the unused box(es) empty.

**Part (c)** [3 MARKS]

Write a good docstring for the function `f` from `module_a`.

Last Name: \_\_\_\_\_ First Name: \_\_\_\_\_

**Short Python function/method descriptions:**

```
__builtins__:
len(x) -> int
    Return the length of the list, tuple, dict, or string x.
raw_input([prompt]) -> str
    Read a string from standard input. The trailing newline is stripped.
float:
float(x) -> float
    Convert a string or number to a floating point number, if possible.
int:
int(x) -> int
    Convert a string or number to an integer, if possible. A floating point
    argument will be truncated towards zero.
media:
add_text(pic, x, y, s, col)
    Draw the str s in Color col on Picture pic starting at (x, y).
choose_file() --> str
    Prompt user to pick a file. Return the path to that file.
copy(Picture) -> Picture
    Return a copy of the Picture.
create_picture(int, int) --> Picture
    Given a width and a height, return a Picture with that width and height. All pixels are white.
get_blue(Pixel) --> int
    Return the blue value of the given Pixel.
get_color(Pixel) --> Color
    Return the Color object with the given Pixel's RGB values.
get_green(Pixel) --> int
    Return the green value of the given Pixel.
get_pixel(Picture, int, int) --> Pixel
    Given x and y coordinates, return the Pixel at (x, y) in the given Picture.
get_red(Pixel) --> int
    Return the red value of the given Pixel.
load_picture(str) --> Picture
    Return a Picture object from file with the given filename.
set_blue(Pixel, int)
    Set the blue value of the given Pixel to the given int value.
set_color(Pixel, Color)
    Set the RGB values of the given Pixel to those of the given Color.
set_green(Pixel, int)
    Set the green value of the given Pixel to the given int value.
set_red(Pixel, int)
    Set the red value of the given Pixel to the given int value.
show(Picture)
    Display the given Picture.
Colors:    black: RGB: 0, 0, 0    white: RGB: 255, 255, 255    yellow: RGB: 255, 255, 0
str:
str(x) -> str
    Convert an object into its string representation, if possible.
S.upper() -> string
    Return a copy of the string S converted to uppercase.
```
