RESEARCH INTERESTS

My primary research interests are in the area of machine learning and computer vision. Within these areas, my work focuses on learning and inference in hierarchical models, as well as on the design of unsupervised learning algorithms, primarily with applications to computer vision, but also to audio processing, robotics and natural language processing. I have developed expertise in a wide range of domains and I have been using a variety of tools including deep learning architectures, probabilistic graphical models, gradient-based learning methods, energy-based models, Markov Chain Monte Carlo methods, variational methods, kernel methods, and computational neural science models of vision. I have applied these models to a variety of applications in vision, such as generic object recognition, handwriting recognition, and image restoration. I have also worked on speech recognition and on natural language processing for retrieval and classification of text documents.
