

## Let's Write Some Code

Write these predicates:

1. uncle
2. aunt
3. nephew
4. niece
5. grandparent
6. ancestor

## Transitive Relations

```

parent(sally,jane).   parent(bob,jane).
parent(sally,john).   parent(bob,john).
parent(mary,sally).  parent(al,sally).
parent(ann,bob).     parent(mike,bob).
parent(jean,al).     parent(joe,al).
parent(ruth,mary).   parent(jim,mary).
parent(esther,ruth). parent(mick,ruth).

grandparent(X,Y) :- parent(X,Z), parent(Z,Y).
ancestor(X,Y) :- parent(X,Y).
ancestor(X,Y) :- parent(X,Z), ancestor(Z,Y).

?- grandparent(Y,jane).
Y = mary ;
Y = al ;
Y = ann ;
Y = mike ;
No

?- ancestor(X,jane).
X = sally ;
X = bob ;
X = mary ;
X = al ;
X = ann ;
X = mike ;
X = jean ;
X = joe ;
X = ruth ;
X = jim ;
X = esther ;
X = mick ;
No

```

34

35

## Steps to a Recursive Predicate

### 1. Predicate Form:

- Choose a predicate name appropriate for something that is true or false.
- Choose mnemonic argument names.

### 2. Spec:

Write the specification in this form:  
*pred* succeeds iff .''

### 3. Base Cases:

- When is it so easy to tell the predicate is true that you needn't check any further?
- Write these base case(s).

### 4. Recursive Cases:

- When it's not trivial, what do you need to know is true before you can be sure the predicate is true?
- This is the antecedent of your rule.
- There may be several non-trivial cases, each needing a rule.

36

## Lists in Prolog

Two ways to describe a list:

### 1. [ elements-with-commas ]

Egs: [a, b, c]  
[]  
[a, [b, c], d, [], e]  
[a, X, c, d]

### 2. [ first | rest ] (rest must be a list)

Egs: [a | [b, c]]  
[a | Rest]

**Question:** Why use the second form with |?

37

## Unifying Lists

```
?- [X, Y, Z] = [john, likes, fish].
```

```
?- [cat] = [X|Y].
```

```
?- [1,2] = [X|Y].
```

```
?- [a,b|C]=[X|Y].
```

```
?- [X,abc,Y]=[X,abc|Y].
```

```
?- [[the|Y]|Z] = [[X,hare] | [is,here]].
```

## Let's Write Some List Predicates

1. member(X, List).
2. append(List1, List2, Result).
3. swapFirstTwo(List1, List2).
4. length(List).

38

39

## List Membership

Definition of member...

```

?- member(a,[a,b]). 
Yes
?- member(a,[b,c]). 
No
?- member(X,[a,b,c]). 
X=a ;
X=b ;
X=c ;
No
?- member(a,[c,b,X]). 
X=a ;
No
?- member(X,Y). 
X=_G72, Y=[_G72|_G73] ;
X=_G74, Y=[_G72,_G74|_G76] ;
X=_G76, Y=[_G72,_G74,_G76|_G77] ;
...

```

Lazy evaluation of potentially infinite data structures

## Append - More than "appending"

Definition of append

Build a list:

```

?- append([a],[b],Y).
Y=[a,b]
Yes

```

Break a list up:

```

?- append(X,[b],[a,b]).
X=[a]
Yes
?- append([a],Y,[a,b]).
Y=[b]
Yes

```

40

41

## Append (cont.)

```
?- append(X,Y,[a,b]).  
X=[];Y=[a,b];  
X=[a];Y=[b];  
X=[a,b];Y=[];  
No  
Generate lists:  
?- append(X,[b],Z).  
X=[];Z=[b];  
X=[_G98];Z=[_G98,b];  
X=[_G98,_G102];Z=[_G98,_G102,b];  
...  
?- length([a,b,c],L).  
L = 3  
?- length([],L).  
L = 0  
?- length(X,3).  
X = [_66,_68,_70]  
?- length(X,0).  
X = []
```

42

## Computing the Length of a List

Definition of `length`...

NOTE: Use built-in `length` function!!

43

## Accessing More Than One Initial Element

Definition of `swap_first_two`...

```
?- swap_first_two([a,b], [b,a]).  
Yes  
?- swap_first_two([a,b], [b,c]).  
No  
?- swap_first_two([a,b,c], [b,a,c]).  
Yes  
?- swap_first_two([a,b,c], [b,a,d]).  
No  
?- swap_first_two([a,b,c], X).  
X = [b,a,c];  
No  
?- swap_first_two([a,b|Y], X).  
Y = _56, X = [b,_56];  
No  
?- swap_first_two([], X).  
No  
?- swap_first_two([a], X).  
No  
?- swap_first_two([a,b], X).  
X = [b,a];  
No
```

44

## Lists of a Specified Length

Definition of `list_of_elem`...

```
?- list_elem(X,b,3).  
X = [b,b,b];  
ERROR: Out of global stack  
?- list_of_elem(X,Y,2).  
X = [_50,_50]  
Y = _50;  
ERROR: Out of global stack
```

45

## Lists of a Specified Length

New definition of `list_of_elem`...

```
?- working_list_elem(X,b,3).  
X = [b,b,b];  
No  
?- working_list_elem(X,Y,2).  
X = [_50,_50]  
Y = _50;  
No
```

46
