

Lecture 18: Structure-based Testing

Test Case First Strategy

White box testing:

- Statement Coverage
- Branch Coverage
- Condition Coverage
- Data Path Coverage

Black box testing:

- Use Cases as Test Cases
- Testing with good and bad data

Developer Testing

Write the test cases first

- minimize the time to defect discovery
- forces you to think carefully about the requirements first
- exposes requirements problems early
- supports a “daily smoke test”

Limitations of Developer Testing

- Emphasis on clean tests (vs. dirty tests)
 - immature organisations have 1 dirty : 5 clean
 - mature organisations have 5 dirty : 1 clean
- Developers overestimate test coverage
- Developers tend to focus on statement coverage rather than ...

Summary:

- Test-case first strategy is extremely valuable
- Test-case first strategy is not enough

Random testing isn't enough

Source: Adapted from Horton, 1999

Structurally...

```

boolean equal (int x, y) {
  /* effects: returns true if
  x=y, false otherwise
  */
  if (x == y)
    return (TRUE)
  else
    return (FALSE)
}

```

Test strategy: pick random values for x and y and test 'equals' on them

But:

...we might never test the first branch of the 'if' statement

Functionally...

```

int maximum (list a)
/* requires: a is a list of
integers
effects: returns the maximum
element in the list
*/

```

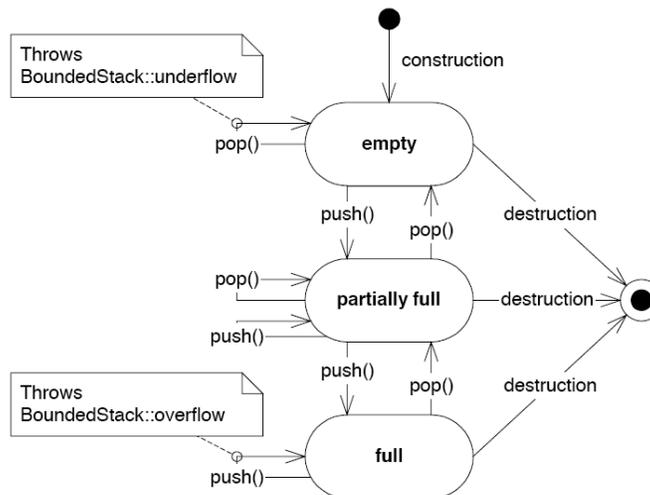

Try these test cases:

Input	Output	Correct?
3 16 4 32 9	32	Yes
9 32 4 16 3	32	Yes
22 32 59 17 88 1	88	Yes
1 88 17 59 32 22	88	Yes
1 3 5 7 9 1 3 5 7	9	Yes
7 5 3 1 9 7 5 3 1	9	Yes
9 6 7 11 5	11	Yes
5 11 7 6 9	11	Yes
561 13 1024 79 86 222 97	1024	Yes
97 222 86 79 1024 13 561	1024	Yes

Why is this not enough?

Testing in every state?

Structured Basis Testing

Source: Adapted from McConnell 2004, p506-508

The minimal set of tests to cover every branch

How many tests?

start with 1 for the straight path

add 1 for each of these keywords: **if**, **while**, **repeat**, **for**, **and**, **or**

add 1 for each branch of a case statement

Example

```

int midval (int x, y, z) {
  /* effects: returns median
  value of the three inputs
  */
  if (x > y) {
    if (x > z) return x
    else return z }
  else {
    if (y > z) return y
    else return z } }

```

Count 1 + 3 'if's = 4 test cases

Now choose the cases to exercise the 4 paths:

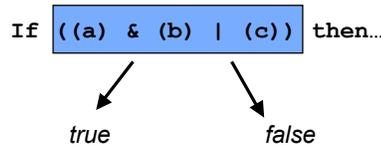

- e.g. x=3, y=2, z=1
- x=3, y=2, z=4
- x=2, y=3, z=2
- x=2, y=3, z=4

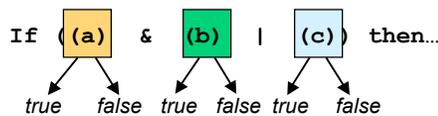

Complex Conditions

Source: Adapted from Christopher Ackermann's slides

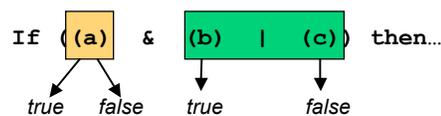

Branch Coverage:

Condition Coverage:

But can you show that each part has an independent effect on the outcome?

MC/DC Coverage

Source: Adapted from Christopher Ackermann's slides

Show that each basic condition can affect the result

If ((a) & (b) | (c)) then...

number	ABC	result	A	B	C
1	TTT	T	5		
2	TTF	T	6	4	
3	TFT	T	7		4
4	TFF	F		2	3
5	FTT	F	1		
6	FTF	F	2		
7	FFT	F	3		
8	FFF	F			

Choose a minimal set:

Eg. {2, 3, 4, 6}

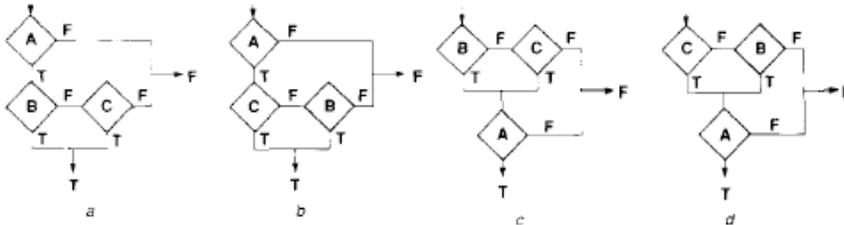

or {2, 3, 4, 7}

MC/DC versus Branch Coverage

Source: Adapted from Christopher Ackermann's slides

Compiler can translate conditions in the object code:

Test sets for condition/decision coverage:

{1, 8} or {2, 7} or {3, 6}

Covers all paths in the source code, but not all paths in the object code

Test sets for Modified Condition/Decision Coverage

{2, 3, 4, 6} or {2, 3, 4, 7}

Covers all paths in the object code

About MC/DC

Advantages:

- Linear growth in the number of conditions
- Ensures coverage of the object code
- Discovers dead code (operands that have no effect)

Mandated by the US Federal Aviation Administration

- In avionics, complex boolean expressions are common
- Has been shown to uncover important errors not detected by other test approaches

It's expensive

- E.g. Boeing 777
- approx 4 million lines of code, 2.5 million newly developed
- approx 70% of this is Ada (rest is C or assembler)
- Total cost of aircraft development: \$5.5 billion
- Cost of testing to MC/DC criteria: approx \$1.5 billion

Dataflow testing

Source: Adapted from McConnell 2004, p506-508

Things that happen to data:

- D**efined - data is initialized but not yet used
- U**sed - data is used in a computation
- K**illed - space is released
- E**ntered - working copy created on entry to a method
- E**xited - working copy removed on exit from a method

Normal life:

- Defined once, Used a number of times, then Killed

Potential Defects:

- D-D**: variable is defined twice
- D-Ex, D-K**: variable defined but not used
- En-K**: destroying a local variable that wasn't defined?
- En-U**: for local variable, used before it's initialized
- K-K**: unnecessary killing - can hang the machine!
- K-U**: using data after it has been destroyed
- U-D**: redefining a variable after it has been used

Testing all D-U paths

Source: Adapted from McConnell 2004, p506-508

The minimal set of tests to cover every D-U path

How many tests?

1 test for each path from each definition to each use of the variable

Example

```

if (Cond1) {
D:   x = a;
}
else {
D:   x = b;
}
if (Cond2) {
U:   y = x + 1;
}
else {
U:   y = x - 1;
}

```

Structured Basis Testing:

2 test cases is sufficient

Case 1: Cond1=true, Cond2=true

Case 2: Cond1=false, Cond2=false

All DU testing:

Need 4 test cases

Boundary Checking

Source: Adapted from McConnell 2004, p506-508

Boundary Analysis

Every boundary needs 3 tests:

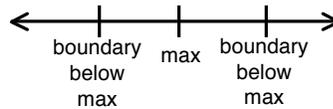

Example:

```

if (x < MAX) {
...
}

```

test for MAX+1, MAX-1 and MAX

Compound Boundaries

When several variables have combined boundaries

```

for (i=0; i<Num; i++) {
  if (a[i] < LIMIT) {
    y = y+a[i];
  }
}

```

Test when lots of array entries are close to the max?

Test when lots of entries are close to zero?

Data Classes

Source: Adapted from McConnell 2004, p506-508

Classes of Bad Data

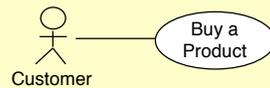

- Too little data (or no data)
- Too much data
- The wrong kind of data (invalid data)
- The wrong size of data
- Uninitialized data

Classes of Good Data

- Nominal cases - middle of the road, expected values
- Minimum normal configuration
- Maximum normal configuration
- Compatibility with old data

Generating Tests from Use Cases

Buy a Product

Precondition: Customer has successfully logged in

Main Success Scenario:
 Customer browses catalog and selects items to buy
 Customer goes to check out
 Customer fills in shipping information (address, next-day or 3-day delivery)
 System presents full pricing information
 Customer fills in credit card information
 System authorizes purchase
 System confirms sale immediately
 System sends confirming email to customer

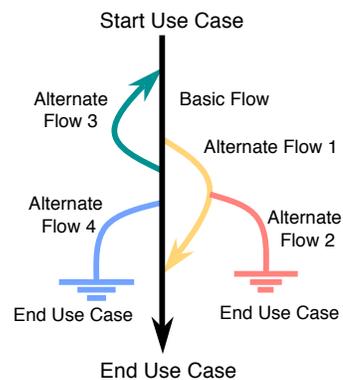

Postcondition: Payment was received in full, customer has received confirmation

Extensions:

- 3a: Customer is Regular Customer
 - .1 System displays current shipping, pricing and billing information
 - .2 Customer may accept or override these defaults, returns to MSS at step 6
- 6a: System fails to authorize credit card
 - .1 Customer may reenter credit card information or may cancel

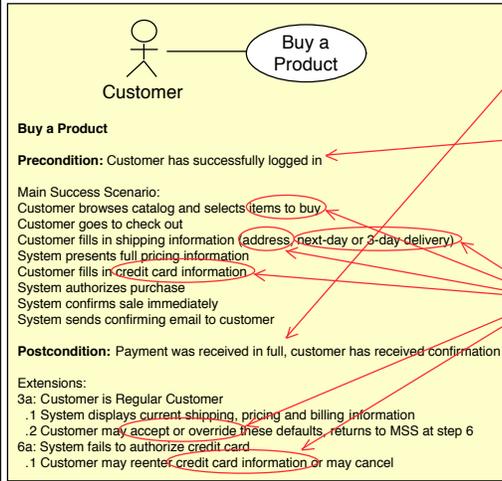

1 Test the Basic Flow

2 Test the Alternate Flows

Generating Tests from Use Cases

3 Test the Postconditions

Are they met on all paths through the use case?
Are all postconditions met?

4 Break the Preconditions

What happens if this is not met?
In what ways might it not be met?

5 Identify options for each variable

select combinations of options for each test case

Classes of input variables

values that trigger alternative flows

e.g. invalid credit card
e.g. regular customer

trigger different error messages

e.g. text too long for field
e.g. email address with no "@"

inputs that cause changes in the appearance of the UI

e.g. a prompt for additional information

inputs that causes different options in dropdown menus

e.g. US/Canada triggers menu of states/provinces

cases in a business rule

e.g. No next day delivery after 6pm

border conditions

if password must be min 6 characters,
test password of 5,6,7 characters

Check the default values

e.g. when cardholder's name is filled automatically

Override the default values

e.g. when the user enters different name

Enter data in different formats

e.g. phone numbers:
(416) 555 1234
416-555-1234
416 555 1234

Test country-specific assumptions

e.g. date order: 5/25/08 vs. 25/5/08

Limits of Use Cases as Test Cases

Use Case Tests good for:

- User acceptance testing
- “Business as usual” functional testing
- Manual black-box tests
- Recording automated scripts for common scenarios

Defects you won’t discover:

- System errors (e.g. memory leaks)
- Things that corrupt persistent data
- Performance problems
- Software compatibility problems
- Hardware compatibility problems

Limitations of Use Cases

- Likely to be incomplete
- Use cases don’t describe enough detail of use
- Gaps and inconsistencies between use cases
- Use cases might be out of date
- Use cases might be ambiguous
