Lecture 13: Object Oriented Modelling

→ Object Oriented Analysis

- ⌘ Rationale
- ⌘ Identifying Classes
- ⌘ Attributes and Operations

→ Class Diagrams

- ⌘ Associations
- ⌘ Multiplicity
- ⌘ Aggregation
- ⌘ Composition
- ⌘ Generalization

Requirements & Domain Models

Reminder: we are modeling this and this ... but not this

→ Our analysis models should...

- ⌘ ...represent people, physical things and concepts important to the analyst's understanding of what is going on in the application domain
- ⌘ ...show connections and interactions among these people, things and relevant concepts.
- ⌘ ...show the business situation in enough detail to evaluate possible designs.
- ⌘ ...be organized to be useful later, during design and implementation of the software.
- ⌘ ...allow us to check whether the functions we will include in the specification will satisfy the requirements
- ⌘ ...test our understanding of how the new system will interact with the world

Object Oriented Analysis

→ Background

- ⌘ Model the requirements in terms of objects and the services they provide
- ⌘ Grew out of object oriented design
 - Applied to modelling the application domain rather than the program

→ Motivation

- ⌘ OO is (claimed to be) more 'natural'
 - As a system evolves, the functions it performs need to be changed more often than the objects on which they operate...
 - ...a model based on objects (rather than functions) will be more stable over time...
 - ...hence the claim that object-oriented designs are more maintainable
- ⌘ OO emphasizes importance of well-defined interfaces between objects
 - compared to ambiguities of dataflow relationships

NOTE: OO applies to requirements engineering because it is a modeling tool. But we are modeling domain objects, not the design of the new system

Nearly anything can be an object...

Source: Adapted from Pressman, 1994, p242

→ External Entities

- ⌘ ...that interact with the system being modeled
 - E.g. people, devices, other systems

→ Things

- ⌘ ...that are part of the domain being modeled
 - E.g. reports, displays, signals, etc.

→ Occurrences or Events

- ⌘ ...that occur in the context of the system
 - E.g. transfer of resources, a control action, etc.

→ Roles

- ⌘ played by people who interact with the system

→ Organizational Units

- ⌘ that are relevant to the application
 - E.g. division, group, team, etc.

→ Places

- ⌘ ...that establish the context of the problem being modeled
 - E.g. manufacturing floor, loading dock, etc.

→ Structures

- ⌘ that define a class or assembly of objects
 - E.g. sensors, four-wheeled vehicles, computers, etc.

Some things cannot be objects:

- ⌘ procedures (e.g. print, invert, etc)
- ⌘ attributes (e.g. blue, 50Mb, etc)

What are classes?

→ A class describes a group of objects with

- ↳ similar properties (attributes),
- ↳ common behaviour (operations),
- ↳ common relationships to other objects,
- ↳ and common meaning ("semantics").

→ Examples

- ↳ employee: has a name, employee# and department; an employee is hired, and fired; an employee works in one or more projects

Finding Classes

→ Finding classes source data:

- ↳ Look for nouns and noun phrases in stakeholders' descriptions of the problem
 - include in the model if they explain the nature or structure of information in the application.

→ Finding classes from other sources:

- ↳ Reviewing background information;
- ↳ Users and other stakeholders;
- ↳ Analysis patterns;

→ It's better to include many candidate classes at first

- ↳ You can always eliminate them later if they turn out not to be useful
- ↳ Explicitly deciding to discard classes is better than just not thinking about them

Selecting Classes

→ Discard classes for concepts which:

- ↳ Are beyond the scope of the analysis;
- ↳ Refer to the system as a whole;
- ↳ Duplicate other classes;
- ↳ Are too vague or too specific
 - e.g. have too many or too few instances
- ↳ Coad & Yourdon's criteria:
 - Retained information: Will the system need to remember information about this class of objects?
 - Needed Services: Do objects in this class have identifiable operations that change the values of their attributes?
 - Multiple Attributes: If the class only has one attribute, it may be better represented as an attribute of another class
 - Common Attributes: Does the class have attributes that are shared with all instances of its objects?
 - Common Operations: Does the class have operations that are shared with all instances of its objects?
- ↳ External entities that produce or consume information essential to the system should be included as classes

Objects vs. Classes

→ The instances of a class are called objects.

↳ Objects are represented as:

- ↳ Two different objects may have identical attribute values (like two people with identical name and address)

→ Objects have associations with other objects

- ↳ E.g. Fred_Bloggs:employee is associated with the KillerApp:project object
- ↳ But we will capture these relationships at the class level (why?)
- ↳ Note: Make sure attributes are associated with the right class
 - E.g. you don't want both managerName and manager# as attributes of Project! (...Why??)

University of Toronto Department of Computer Science

Associations

→ **Objects do not exist in isolation from one another**

- ↳ A relationship represents a connection among things.
- ↳ In UML, there are different types of relationships:
 - > Association
 - > Aggregation and Composition
 - > Generalization
 - > Dependency
 - > Realization
- ↳ Note: The last two are not useful during requirements analysis

→ **Class diagrams show classes and their relationships**

```

classDiagram
    class Client {
        <<entity>>
        companyAddress
        companyName
        companyTelephone
        companyFax
        companyEmail
        getClientCampaigns()
        getClients()
    }
    class Campaign {
        <<entity>>
        title
        campaignStartDate
        campaignFinishDate
        getCampaignAdverts()
        addNewAdvert()
    }
    class Advert {
        <<entity>>
        setCompleted()
        createNewAdvert()
    }
    Client "1" -- "0..*" Campaign : places
    Campaign "1" -- "0..*" Advert : conducted by
  
```

© Easterbrook 2004 9

University of Toronto Department of Computer Science

Association Multiplicity

→ **Ask questions about the associations:**

- ↳ Can a campaign exist without a member of staff to manage it?
 - > If yes, then the association is optional at the Staff end - zero or one
- ↳ If a campaign cannot exist without a member of staff to manage it then it is not optional
- ↳ if it must be managed by one and only one member of staff then we show it like this - exactly one
- ↳ What about the other end of the association?
- ↳ Does every member of staff have to manage exactly one campaign?
 - > No. So the correct multiplicity is zero or more.

→ **Some examples of specifying multiplicity:**

| | |
|---------------------|---------------------|
| ↳ Optional (0 or 1) | 0..1 |
| ↳ Exactly one | 1 = 1..1 |
| ↳ Zero or more | 0..* = * |
| ↳ One or more | 1..* |
| ↳ A range of values | 1..6 |
| ↳ A set of ranges | 1..3,7..10,15,19..* |

Class associations

```

classDiagram
    class StaffMember {
        staffName
        staff#
        staffStartDate
    }
    class Client {
        companyAddress
        companyEmail
        companyFax
        companyName
        companyTelephone
        ClientList
    }
    StaffMember "1" -- "0..*" Client : liaises with
  
```

Multiplicity
A client has exactly one staffmember as a contact person

Multiplicity
A staff member has zero or more clients on His/her clientList

Name of the association
liaises with

Direction
The "liaises with" association should be read in this direction

Role
The staffmember's role in this association is as a contact person

Role
The clients' role in this association is as a clientList

© Easterbrook 2004 11

University of Toronto Department of Computer Science

More Examples

```

classDiagram
    class Campaign {
    }
    class Advert {
    }
    class Grade {
        gradeName
    }
    class StaffMember {
        staffName
        staffNo
        staffStartDate
    }
    class Hand {
    }
    class Card {
    }
    Campaign "1" -- "0..*" Advert : conducted by
    Grade "1..*" -- "0..*" StaffMember : allocated to
    Hand "0..1" -- "1..7" Card : contains
  
```

© Easterbrook 2004 12

University of Toronto Department of Computer Science

Association Classes

→ Sometimes the association is itself a class

- ↳ ...because we need to retain information about the association
- ↳ ...and that information doesn't naturally live in the classes at the ends of the association
 - E.g. a "title" is an object that represents information about the relationship between an owner and her car

13

© Easterbrook 2004

University of Toronto Department of Computer Science

Aggregation and Composition

→ Aggregation

- ↳ This is the "Has-a" or "Whole/part" relationship

→ Composition

- ↳ Strong form of aggregation that implies ownership:
 - if the whole is removed from the model, so is the part.
 - the whole is responsible for the disposition of its parts

14

© Easterbrook 2004

University of Toronto Department of Computer Science

Generalization

→ Notes:

- ↳ Subclasses inherit attributes, associations, & operations from the superclass
- ↳ A subclass may override an inherited aspect
 - e.g. AdminStaff & CreativeStaff have different methods for calculating bonuses
- ↳ Superclasses may be declared [abstract], meaning they have no instances
 - Implies that the subclasses cover all possibilities
 - e.g. there are no other staff than AdminStaff and CreativeStaff

15

University of Toronto Department of Computer Science

More on Generalization

→ Usefulness of generalization

- ↳ Can easily add new subclasses if the organization changes

→ Look for generalizations in two ways:

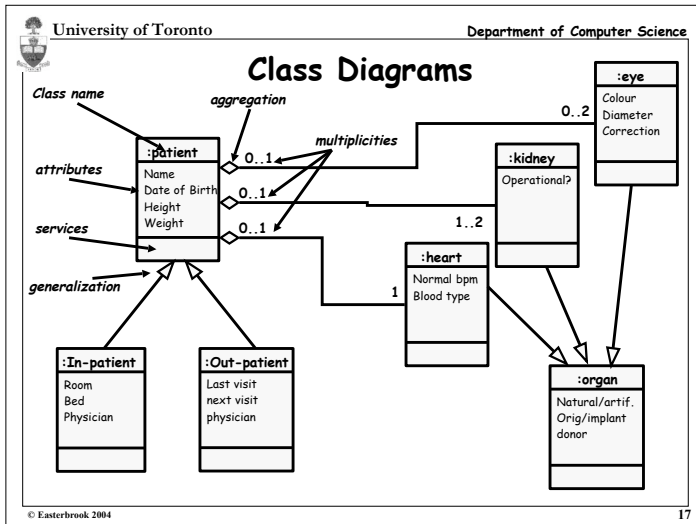

- ↳ Top Down
 - You have a class, and discover it can be subdivided
 - Or you have an association that expresses a "kind of" relationship
 - E.g. "Most of our work is on advertising for the press, that's newspapers and magazines, also for advertising hoardings, as well as for videos"
- ↳ Bottom Up
 - You notice similarities between classes you have identified
 - E.g. "We have books and we have CDs in the collection, but they are all filed using the Dewey system, and they can all be lent out and reserved"

→ But don't generalize just for the sake of it

- ↳ Be sure that everything about the superclass applies to the subclasses
- ↳ Be sure that the superclass is useful as a class in its own right
 - I.e. not one that we would discard using our tests for useful classes
- ↳ Don't add subclasses or superclasses that are not relevant to your analysis

Evaluation of OOA

→ **Advantages of OO analysis for RE**

- ☞ Fits well with the use of OO for design and implementation
 - Transition from OOA to OOD 'smoother' (but is it?)
- ☞ Removes emphasis on functions as a way of structuring the analysis
- ☞ Avoids the fragmentary nature of structured analysis
 - object-orientation is a coherent way of understanding the world

→ **Disadvantages**

- ☞ Emphasis on objects brings an emphasis on static modeling
 - although later variants have introduced dynamic models
- ☞ Not clear that the modeling primitives are appropriate
 - are objects, services and relationships really the things we need to model in RE?
- ☞ Strong temptation to do design rather than problem analysis
- ☞ Fragmentation of the analysis
 - E.g. reliance on use-cases means there is no "big picture" of the user's needs
- ☞ Too much marketing hype!
 - and false claims - e.g. no evidence that objects are a more natural way to think
