## Lecture 13: Object Oriented Modelling

- Object Oriented Analysis
  - Rationale
  - Identifying Classes
  - Attributes and Operations
- Class Diagrams
  - Associations
  - Multiplicity
  - Aggregation
  - Composition
  - Generalization

## Requirements & Domain Models

Reminder: we are modeling this and this ... but not this

- Our analysis models should...
  - ...represent people, physical things and concepts important to the analyst's understanding of what is going on in the application domain
  - ...show connections and interactions among these people, things and relevant concepts.
  - ...show the business situation in enough detail to evaluate possible designs.
  - ...be organized to be useful later, during design and implementation of the software.
  - ...allow us to check whether the functions we will include in the specification will satisfy the requirements
  - ...test our understanding of how the new system will interact with the world

## Object Oriented Analysis

- Background
  - Model the requirements in terms of objects and the services they provide
  - Grew out of object oriented design
    - Applied to modelling the application domain rather than the program
- Motivation
  - OO is (claimed to be) more 'natural'
    - As a system evolves, the functions it performs need to be changed more often than the objects on which they operate...
    - a model based on objects (rather than functions) will be more stable over time...
    - hence the claim that object-oriented designs are more maintainable
  - OO emphasizes importance of well-defined interfaces between objects
    - compared to ambiguities of dataflow relationships

**NOTE: OO applies to requirements engineering because it is a modeling tool. But we are modeling domain objects, not the design of the new system**

## Nearly anything can be an object...

Source: Adapted from Pressman, 1994, p242

- External Entities
  - ...that interact with the system being modeled
    - E.g. people, devices, other systems
- Things
  - ...that are part of the domain being modeled
    - E.g. reports, displays, signals, etc.
- Occurrences or Events
  - ...that occur in the context of the system
    - E.g. transfer of resources, a control action, etc.
- Roles
  - played by people who interact with the system
- Organizational Units
  - that are relevant to the application
    - E.g. division, group, team, etc.
- Places
  - ...that establish the context of the problem being modeled
    - E.g. manufacturing floor, loading dock, etc.
- Structures
  - that define a class or assembly of objects
    - E.g. sensors, four-wheeled vehicles, computers, etc.

**Some things cannot be objects:**

- procedures (e.g. print, invert, etc)
- attributes (e.g. blue, 50Mb, etc)

## What are classes?

→ A class describes a group of objects with

- ↳ similar properties (attributes),
- ↳ common behaviour (operations),
- ↳ common relationships to other objects,
- ↳ and common meaning ("semantics").

→ Examples

- ↳ employee: has a name, employee# and department; an employee is hired, and fired; an employee works in one or more projects

## Finding Classes

→ Finding classes source data:

- ↳ Look for nouns and noun phrases in stakeholders' descriptions of the problem
  - include in the model if they explain the nature or structure of information in the application.

→ Finding classes from other sources:

- ↳ Reviewing background information;
- ↳ Users and other stakeholders;
- ↳ Analysis patterns;

→ It's better to include many candidate classes at first

- ↳ You can always eliminate them later if they turn out not to be useful
- ↳ Explicitly deciding to discard classes is better than just not thinking about them

## Selecting Classes

→ Discard classes for concepts which:

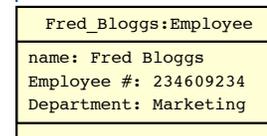

- ↳ Are beyond the scope of the analysis;
- ↳ Refer to the system as a whole;
- ↳ Duplicate other classes;
- ↳ Are too vague or too specific
  - e.g. have too many or too few instances
- ↳ Coad & Yourdon's criteria:
  - Retained information: Will the system need to remember information about this class of objects?
  - Needed Services: Do objects in this class have identifiable operations that change the values of their attributes?
  - Multiple Attributes: If the class only has one attribute, it may be better represented as an attribute of another class
  - Common Attributes: Does the class have attributes that are shared with all instances of its objects?
  - Common Operations: Does the class have operations that are shared with all instances of its objects?
- ↳ External entities that produce or consume information essential to the system should be included as classes

## Objects vs. Classes

→ The instances of a class are called objects.

↳ Objects are represented as:

- ↳ Two different objects may have identical attribute values (like two people with identical name and address)

→ Objects have associations with other objects

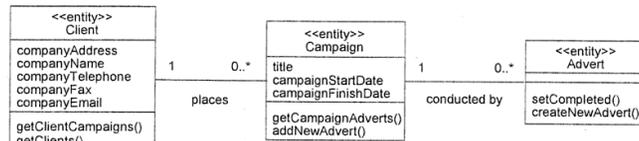

- ↳ E.g. Fred\_Bloggs:employee is associated with the KillerApp:project object
- ↳ But we will capture these relationships at the class level (why?)
- ↳ Note: Make sure attributes are associated with the right class
  - E.g. you don't want both managerName and manager# as attributes of Project! (...Why??)

## Associations

→ Objects do not exist in isolation from one another

- ↳ A relationship represents a connection among things.
- ↳ In UML, there are different types of relationships:
  - > Association
  - > Aggregation and Composition
  - > Generalization
  - > Dependency
  - > Realization
- ↳ Note: The last two are not useful during requirements analysis

→ Class diagrams show classes and their relationships

## Association Multiplicity

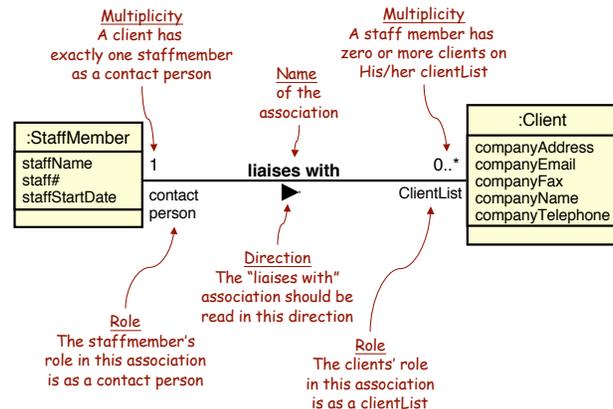

→ Ask questions about the associations:

- ↳ Can a campaign exist without a member of staff to manage it?
  - > If yes, then the association is optional at the Staff end - zero or one
- ↳ If a campaign cannot exist without a member of staff to manage it
  - > then it is not optional
- ↳ if it must be managed by one and only one member of staff then we show it like this - exactly one
- ↳ What about the other end of the association?
- ↳ Does every member of staff have to manage exactly one campaign?
  - > No. So the correct multiplicity is zero or more.

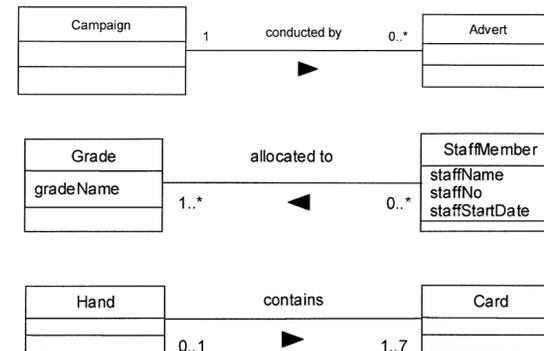

→ Some examples of specifying multiplicity:

- ↳ Optional (0 or 1)      0..1
- ↳ Exactly one            1      = 1..1
- ↳ Zero or more          0..\*    = \*
- ↳ One or more            1..\*
- ↳ A range of values      1..6
- ↳ A set of ranges         1..3,7..10,15,19..\*

## Class associations

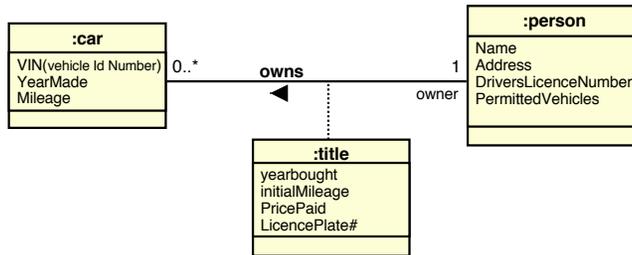

## More Examples

## Association Classes

→ Sometimes the association is itself a class

- ↳ ...because we need to retain information about the association
- ↳ ...and that information doesn't naturally live in the classes at the ends of the association
  - E.g. a "title" is an object that represents information about the relationship between an owner and her car

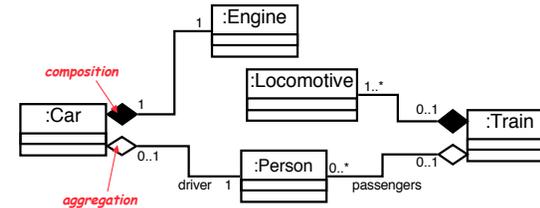

## Aggregation and Composition

→ Aggregation

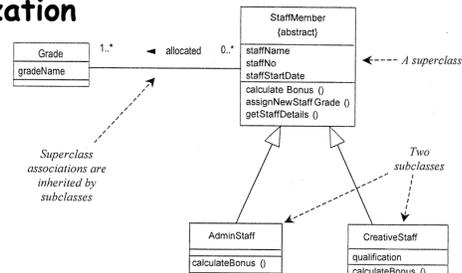

- ↳ This is the "Has-a" or "Whole/part" relationship

→ Composition

- ↳ Strong form of aggregation that implies ownership:
  - if the whole is removed from the model, so is the part.
  - the whole is responsible for the disposition of its parts

## Generalization

→ Notes:

- ↳ Subclasses inherit attributes, associations, & operations from the superclass
- ↳ A subclass may override an inherited aspect
  - e.g. AdminStaff & CreativeStaff have different methods for calculating bonuses
- ↳ Superclasses may be declared **(abstract)**, meaning they have no instances
  - Implies that the subclasses cover all possibilities
  - e.g. there are no other staff than AdminStaff and CreativeStaff

## More on Generalization

→ Usefulness of generalization

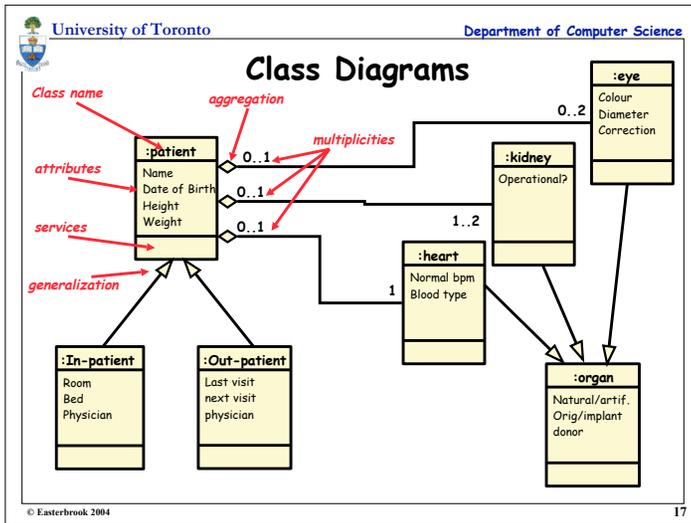

- ↳ Can easily add new subclasses if the organization changes

→ Look for generalizations in two ways:

- ↳ **Top Down**
  - You have a class, and discover it can be subdivided
  - Or you have an association that expresses a "kind of" relationship
  - E.g. "Most of our work is on advertising for the press, that's newspapers and magazines, also for advertising hoardings, as well as for videos"
- ↳ **Bottom Up**
  - You notice similarities between classes you have identified
  - E.g. "We have books and we have CDs in the collection, but they are all filed using the Dewey system, and they can all be lent out and reserved"

→ But don't generalize just for the sake of it

- ↳ Be sure that everything about the superclass applies to the subclasses
- ↳ Be sure that the superclass is useful as a class in its own right
  - I.e. not one that we would discard using our tests for useful classes
- ↳ Don't add subclasses or superclasses that are not relevant to your analysis

University of Toronto Department of Computer Science

## Evaluation of OOA

→ **Advantages of OO analysis for RE**

- ↳ Fits well with the use of OO for design and implementation
  - Transition from OOA to OOD 'smoother' (but is it?)
- ↳ Removes emphasis on functions as a way of structuring the analysis
- ↳ Avoids the fragmentary nature of structured analysis
  - object-orientation is a coherent way of understanding the world

→ **Disadvantages**

- ↳ Emphasis on objects brings an emphasis on static modeling
  - although later variants have introduced dynamic models
- ↳ Not clear that the modeling primitives are appropriate
  - are objects, services and relationships really the things we need to model in RE?
- ↳ Strong temptation to do design rather than problem analysis
- ↳ Fragmentation of the analysis
  - E.g. reliance on use-cases means there is no "big picture" of the user's needs
- ↳ Too much marketing hype!
  - and false claims - e.g. no evidence that objects are a more natural way to think
