1 General Guidelines

The idea of the final project is to give you some experience trying to do a piece of original research in machine learning and writing up your results in a paper style format. What we expect to see is an idea/task that you describe clearly, relate to existing work, implement and test on a dataset. To do this you will need to write code, run it on some data, make some figures, read a few background papers, collect some references, and write a few pages describing your task, the algorithm(s) you used and the results you obtained. As a rough rule of thumb, spend about one week’s worth of work (spread out over a longer time to allow the computers to do some work in the interim!), and about a day writing it up after that. Projects can be done individually, or in pairs (or larger groups with permission). We encourage you to work in pairs, but of course, the expectations will be higher for pair projects.

2 Specific Requirements

Your project must implement one or more machine learning algorithms and apply them to some data. Your project may be a comparison of several existing algorithms, or it may propose a new algorithm in which case you still must compare it to at least one other approach. You can either pick a project of your own design, or you can choose from the set of pre-defined projects described below. Regardless of which way you select a project, you cannot use the excuse that you got a “bad project” to explain doing a poor job on it. So select wisely!

You are free to use any third-party ideas or code that you wish as long as it is publicly available. You must properly provide references to any work that is not your own in the write-up. The project is not intended to be a stressful exercise; instead it is a chance for you to experiment, to think, to play and to hopefully have fun! Start with simple methods that work more or less out of the box and go from there.

2.1 Project proposal

You must turn in a brief project proposal. Your project proposal should describe the idea behind your self-defined project. You should also briefly describe software you will need to write, and papers (2-3) you plan to read. Please also say if you will have a partner, and if so, who it will be.

Include your email address on your proposal. We need this to contact you and arrange meetings to discuss your proposal. The proposal is due Nov. 4, by email to csc411ta@cs.toronto.edu.
2.2 Project submission

Your submission must include at least two figures which graphically illustrate quantitative aspects of your results, such as training/testing error curves, learned parameters, algorithm outputs, input data sorted by results in some way, etc. Your submission must include at least 3 references to previous published papers or book sections. Your submission should follow the generally accepted style of paper writing: include an introduction section to motivate your problem and algorithm, a section describing your approach and how it compares to previous work, a section outlining the experiments you ran and the results you obtained, and a short conclusions section to sum up what you discovered. Your submission must be prepared in the NIPS paper format [http://nips.cc/Conferences/2015/PaperInformation/StyleFiles](http://nips.cc/Conferences/2015/PaperInformation/StyleFiles) and must be no longer than 6 pages (10 for pair projects) including the figures and tables and references. Do not hand in any code of any kind.

2.3 Marking scheme

The following criteria will be taken into account when marking:

- Clarity/Relevance of problem statement and description of approach.
- Discussion of relationship to previous work and references.
- Design and execution of experiments.
- Figures/Tables/Writing: easily readable, properly labeled, informative.

2.4 Own Project

You can work on a different project if you want to. Towards this goal, you should submit a one page proposal describing in detail the goal of the project, the data as well as which techniques you plan to use. You are also encouraged to apply machine learning techniques on the open problems in your own research areas. You may also choose a public problem from a website such as Kaggle. In this case you will need to develop and analyze the performance of at least two different ML approaches to the target problem.

BONUS: Bonus will be given according to the importance and difficulty of your problem, the techniques you use and the performance you have achieved compared with the state-of-the-art (with up to 30% extra).

3 Deadlines and Submission Instructions

Make sure that you don’t miss any of the following deadlines:

- The project proposal should be submitted electronically via email to csc411ta@cs.toronto.edu. The submission deadline is noon on November 4th.
- The project report should be submitted via MarkUs by noon on December 5th. Name your submission Project-\*your-student-id*.pdf. A penalty of 25% will be applied per day that the submission is late.
