

Homework Assignment #4  
Due: February 12, 2025, by 11:59 pm

- **You must submit your assignment through the Crowdmark system.** You will receive by email an invitation through which you can submit your work in the form of separate PDF documents with your answers to each question of the assignment. To work with a partner, you and your partner must form a group on Crowdmark. Crowdmark does not enforce a limit on the size of groups. **The course policy that limits the size of each group to at most two remains in effect:** submissions by groups of more than two persons will not be graded.
- To minimize bias in grading, Crowdmark does not reveal your name to the grader. Please do not subvert this feature by including your name(s) on the files you submit.
- It is your responsibility to ensure that the files you submit are legible. To this end, I encourage you to learn and use the LaTeX typesetting system, which is designed to produce high-quality documents that contain mathematical notation. You are not required to produce the files you submit using LaTeX; you may produce it any way you wish, as long as the resulting document is legible.
- By virtue of submitting this assignment you (and your partner, if you have one) acknowledge that you are aware of the policy on homework collaboration for this course.<sup>a</sup>
- For any question, you may use facts previously proved in this course, its prerequisites, or in the assigned sections of the textbook.
- Unless we explicitly state otherwise, you should justify your answers. Your paper will be graded based on the correctness of your answers, and the clarity, precision, and conciseness of your presentation.

<sup>a</sup> “In each homework assignment you may collaborate with at most one other student who is currently taking CSC63. If you collaborate with another student on an assignment, you and your partner must submit only one copy of your solution, with both of your names. The solution will be graded in the usual way and both partners will receive the same mark. Collaboration involving more than two students is not allowed. **For help with your homework you may consult only the instructor, TAs, your homework partner (if you have one), your textbook, and your class notes. You may not consult any other source.**”

In your answers for this assignment you may appeal to Church’s thesis when arguing that a language is decidable or recognizable, or that a function is computable. That is, you may replace an argument that a Turing machine for a certain task exists by a description, in high-level pseudocode, of an algorithm that achieves this task.

**Question 1.** (30 marks) For each of the following sets **and its complement**, classify it as (a) decidable, (b) undecidable but recognizable, or (c) unrecognizable. Justify your answer. In all sets defined below,  $M$ ,  $M_1$ , and  $M_2$  stand for Turing machine recognizers.

$$A = \{\langle M_1, M_2 \rangle : \text{for some string } x, \text{ at least one of } M_1 \text{ and } M_2 \text{ accepts both } x \text{ and } xx\}$$

$$B = \{\langle M, x, q \rangle : M \text{ on input } x \text{ is in state } q \text{ in at least two moves}\}$$

$$C = \{\langle M, x \rangle : M \text{ on input } x \text{ is in the same state in at least two moves}\}$$

$$D = \{\langle M_1, M_2 \rangle : |\mathcal{L}(M_1) \cap \mathcal{L}(M_2)| = 5\}$$

$$E = \{\langle M \rangle : \mathcal{L}(M) = \Sigma_M^*, \text{ where } \Sigma_M \text{ is the input alphabet of } M\}$$

For sets  $B$  and  $C$  defined above, the predicate “Turing machine  $M$  on input  $x$  is in state  $q$  in at least  $k$  moves” means that the computation of  $M$  on input  $x$  has at least  $k$  configurations (including the initial one) in which  $M$  is in state  $q$ .

*For each set and its complement be sure to write your answer starting on a new sheet of paper*, as you will be asked to submit these answers as five separate files.

**Question 2.** (20 marks) We say that two languages  $A$  and  $B$  are *mapping equivalent*, written  $A \equiv_m B$  if and only if each mapping reduces to the other; i.e.,  $A \leq_m B$  and  $B \leq_m A$ . Let

$$\begin{aligned}\text{ALL} &= \{\langle M \rangle : \mathcal{L}(M) = \Sigma_M^*, \text{ where } \Sigma_M \text{ is the input alphabet of } M\} \\ \text{INFIN} &= \{\langle M \rangle : \mathcal{L}(M) \text{ is infinite}\}.\end{aligned}$$

That is, ALL is the set of codes of Turing machines that accept every string in their input alphabet (the same as set  $E$  in Question 1), and INFIN is the set of codes of Turing machines that accept an infinite number of strings.

- (a) Prove that  $\text{ALL} \equiv_m \text{INFIN}$ . (**Hint:**  $M$  accepts an infinite number of strings if and only if for any string  $x$ ,  $M$  accepts some string  $y$  that follows  $x$  in shortlex order.)
- (b) Prove that  $\text{ALL} \not\equiv_m \text{UNIV}$ .
