How to succeed in CSCC73

Vassos Hadzilacos

Success in this course is to master the material to a degree that will enable you to solve new computational problems efficiently, using the algorithmic techniques taught here. If you work effectively towards this goal, you will perform well and earn a good grade.

A necessary condition to succeed in this course is to devote sufficient time to it. The time a student needs to master the material depends on the individual, but a typical student should plan to devote 10-12 hours per week to the course, *every week* of the semester. This includes the 3-4 hours needed to attend the lectures and the tutorial. I emphasize “every week” because the subject matter does not lend itself to cramming: You need time to engage with and absorb the material in the ways I describe below.

Devoting enough time is a necessary, but not sufficient, condition for success. In the rest of this note I will suggest how you can make effective use of your time.

1. **Before the lecture.** The most important preparation before each lecture (other than the first one!) is to review the previous lecture. This is because a lecture often builds on concepts introduced in the preceding one.

2. **During the lecture.** Pay attention, take notes, ask questions. Don’t get distracted or distract others — so, just before the lecture starts, turn off your mobile and the wifi on your laptop. Lectures are very compact; if you miss a key definition or remark, you may find it impossible to pick up the thread of the argument later on.

   Lectures will be recorded by WebOption and made available to the class; they are posted on the “Media Gallery” section of the course’s Quercus page usually within 24 hours of the recording. *I strongly advise attending lectures in person,* and using recordings only as a supplementary tool, not as your primary source of information for the material. There are several reasons for this: First, the ability to interact in real time during the lectures results in a better learning experience for the students, and is useful to the teacher as well. Second, relying on recordings encourages falling behind; for this course this is recipe for disaster. Third, the university experience (both academic and social) is greatly impoverished if your interactions with your fellow students and your professors are mediated through a screen, and especially so if they are limited to passive viewing of videos. Recordings can be valuable for reviewing material you did not fully grasp in lecture, and for midterm test and final exam preparation.

3. **Soon after the lecture.** Carefully go over your notes and over the assigned material in one of the textbooks. As a student, I found it useful in some courses to reorganize and rewrite my class notes into my “official” course notebook. This allowed me to review the material and make corrections to my notes while the lecture was still fresh in my mind.

   You are not merely reading, you are *studying* — and this requires a more active engagement. You need pen and paper to sketch out ideas, create examples, draw pictures, work out detailed calculations, etc. You need to do this in a quiet environment with no distractions, and you need sustained focus for this effort to pay off.

   It is OK to study in (small) groups, as long as the group isn’t a distraction but a resource to help you learn. In fact, a (small) group can be helpful not only because you will have some of your own questions answered but also because it will afford you the opportunity to answer other people’s questions. Nothing helps understanding a subject better than explaining it to someone else. I learned far more as a teacher than I did
as a student. In connection with study groups, however, take careful note of the course policy on homework collaboration (see the course web page, http://www.cs.toronto.edu/~vassos/teaching/c73).

Make sure you understand everything. Jot down anything that is unclear and return to it later on your own; if you cannot understand it on your own, ask me or post a question on the course forum.

4. Do the homework; start early. Homework assignments are a crucial learning tool in this course. They enhance learning in two ways: One is by exposing gaps in your understanding. If you are unable to do a problem, it may be that you need to go back and study more carefully the material on which the problem is based. The second way in which homework assignments enhance learning is by having you actually use your newly acquired knowledge to solve new problems — the definition of success in this course. This requires a deeper level of understanding and is a form of the much venerated “experiential learning”: learning by actively doing.

The assignments are designed to be reasonably challenging; they are not meant to be routine exercises, and they cannot be completed in a short period of time. A typical student should plan to spend three to four hours per week on average on the homework assignments. (Note: this is per week, not per assignment!) It is therefore important that you start working on each homework assignment as soon as it is posted.

Don’t start working on your homework until after you have completed item 3, i.e., until you have studied carefully the material on which the homework is based. Failing to heed this advice is a surprisingly common mistake. It seems like an expedient shortcut (“I will study only what I need to get this blasted homework out of my way”) but it is counterproductive and ultimately wasteful. You are very unlikely to do a good job on a homework assignment if you haven’t studied the material on which it is based; moreover, you are unlikely to identify the minimal material necessary to solve a problem you have not yet solved.

As per the course policy, you may work with a partner on homework assignments. Don’t share the work by dividing the homework in two and having each partner do half of it. Doing so will rob you of half of the above-mentioned benefit of doing homework. Instead, each partner should initially work on all problems alone; after an honest first effort, you can get together with your partner to exchange ideas and try to make progress on the parts that you were unable to solve on your own, or to perfect the better of the approaches you devised.

5. Seek help when you need it. I am here to help. If you don’t understand something, don’t hesitate to ask. I will not judge your intelligence or base your course performance by the questions you ask, so don’t let such inhibitions get in the way of learning. Individual interaction during office hours is the best way to get help. The Piazza forum is another option. Email affords neither the immediacy of individual interaction nor the efficiency of Piazza’s multi-party interaction; it should be used only when the other two options are not available. (Note that you can ask me questions privately on Piazza.)

My answers to your questions may well take the form of other questions or of advice as to what to study again, more carefully. This isn’t because I am too lazy or too coy to give a straight answer, but because arriving at the answer by yourself with some guidance puts you in a better position to tackle a new problem than simply being handed the answer.
