Course Description
This is an introductory course on computer networks. Topics covered in this course include packet switching systems, socket programming, network software, hardware, and protocols, network naming and addressing, congestion control schemes, software-defined networking, network security, and wireless networking. The emphasis of the course is network programming and applications.

Prerequisites
You need to have a basic understanding of probability theory, a strong background in C, a good understanding of Python, and familiarity with the Unix operating system. If you are not sure whether you have the background to take this course, please take a look at the first programming assignment (link available at the class web page) to get an idea of the type of work, and the amount of time you will need to spend on it. If you still are not sure, send me an e-mail.

Teaching Assistants
Please check class web page for information about TAs, and their office hours.

Bulletin Board and Class Mailing List
Please use the bulletin board (on Piazza) to ask questions from the TAs. You can find a link to the bulletin board on class web page. By using the bulletin board, everyone in class can read the replies and the overall number of repeat questions is reduced. Please check the bulletin board before posting any new questions. We guarantee any question posted to the bulletin board will be responded within 48 hours. There is no guarantee on when you will get a reply to e-mails. We really want you to use the bulletin board. :-}
There is also a class mailing list that will be used by the TAs and the instructor for announcements. Please never use the class mailing list for questions. There are many students in this class and we'd all be flooded with e-mails.

If you have any questions that cannot be posted on the bulletin board (e.g. questions about your grades), you can e-mail the TAs directly.

**Exams**
There will be an in class midterm exam on October 25th for Section L0201 (please consult with your instructor for other sections). There is also a final exam. For date, and location of the final exam, please check the class web page. All graduate students enrolled in this course are required to complete the midterm and final exams.

**Textbook**

**Recommended Books**

**Notes and Handouts**
I will use a combination of slides and blackboard. Please take notes when I am using the blackboard. The handouts will be available on class web page, so you don’t need to take notes.

**Grading**
- Assignments: 50%
  - Problem sets: 20%
  - Programming assignments: 30%
- Midterm exam: 20%
- Final exam: 30%

**Assignments**
There will be two problem sets, both based on the textbook, and the material covered in the class.

There will also be two programming assignments. Here is a summary of the requirements for all submitted programming assignments:
- We will use a virtualized network environment (MiniNet) for programming assignments.
- Each student will get access to a virtual machine (on CDF servers) where she/he can complete the programming assignments.
• To ensure compatibility with our marking scripts, please make sure you only use the VM provided through CDF.
• All programs must be written in ANSI “C”. To make the grading uniform, we can’t except assignments in C++, Python, Java, Perl, ....
• Additional information and requirements will be specified in each assignment.

**Late Submission Policy**

You have *one* free late submission of 24 hours for one of the assignments (problem set, or programming, but not both). You should e-mail the TAs before the deadline to get the free late submission. This 24 hour limit is hard, and cannot be extended. For any late submission other than the free one, 10% of the mark will be deducted for each day late, up to 20%. Assignments will not be accepted after two days.

**Academic Offenses**

“Briefly, an academic offense is a bad thing done to get marks you don't deserve. Slightly more formally, an academic offense is an action by a student or course instructor that breaks the rules about academic credit at the University of Toronto.” Cheating is considered a very serious offense. Please avoid it! We are all here to teach and learn after all, and concerns about cheating make an unpleasant environment for everyone.

**Permitted Collaboration**

The following items are encouraged and allowed at all times for all students in this class:

- Discussion of material covered during lecture, problem sessions, or in handouts
- Discussion of the requirements of an assignment
- Discussion of the use of tools or development environments
- Discussion of general approaches to solving problems
- Discussion of general techniques of coding or debugging
- Discussion between a student and a TA or instructor for the course

**Collaboration Requiring Citation**

Two students engaging in more detailed discussions must be careful to document their collaboration. Students are required to include the names of those who provide specific assistance to properly credit their contribution, in the same manner as one would cite a reference in a research paper. The expectation is that even with a citation, the author must be able to explain the solution.

**Examples of Collaboration That Require Citation**

- Discussing the “key” to a problem set or programming assignment. Problem set questions are often designed such that the critical concept takes careful thought and gaining that insight from someone else must therefore be documented.
- Discussing the design of a programming project. Design is a crucial aspect of the programming process and discussion can be valuable. Any design input received from others must be cited.
• Receiving assistance from another student in debugging code. While the TAs are the preferred source for advice, any detailed assistance from someone else must be credited.
• Sharing advice for testing. For example, if someone provides important information on lessons learned (“my program didn’t handle the case where the value was 0”) that source must be credited.
• Research from alternative sources. Researching related topics, such as through the Internet, must be documented if the solution submitted is derived from the research information.

Unpermitted Collaboration
All submissions must represent original, independent work. Some examples of activities that do not represent original work include:
• Copying solutions from others. In particular, do not ask anyone to provide a copy of his or her solution or, conversely, give a solution to another student who requests it. Similarly, do not discuss algorithmic strategies to such an extent that you and your collaborator submit exactly the same solution. Use of solutions posted to websites, such as at other universities, is prohibited. Be aware that we photocopy some of the exams prior to handing them back.
• Using work from past classes. The use of another student's solution or the posted class solutions from a previous class constitutes a violation.
• Studying another student's solution. Do not read another solution submission whether in electronic or printed form, even to "check answers."
• Debugging code for someone else. When debugging code it is easy to inadvertently copy code or algorithmic solutions. It is acceptable to describe a problem and ask for advice on a way to track down the bug.
