

# Predicate Logic: Logical Consequence

Alice Gao

Lecture 15

# Outline

The Learning Goals

Definition of Logical Consequence

Proving/Disproving a Logical Consequence

Revisiting the Learning Goals

# Learning goals

By the end of this lecture, you should be able to:

- ▶ Define logical consequence for predicate logic.
- ▶ Prove that a logical consequence holds.
- ▶ Prove that a logical consequence does not hold.

# Definition of Logical Consequence

Define the symbols.

- ▶  $\Sigma$  is a set of predicate formulas.
- ▶  $A$  is a predicate formula.

$\Sigma \models A$

( $\Sigma$  logically implies  $A$ )

( $A$  is a logical consequence of  $\Sigma$ )

iff for every valuation  $v$ , if  $\Sigma^v = 1$ , then  $A^v = 1$ .

## Prove a logical consequence

Consider the logical consequence  $\Sigma \models A$ .

To prove that the logical consequence holds, we need to consider

- (A) Every valuation  $v$  such that  $\Sigma^v = 1$ .
- (B) Every valuation  $v$  such that  $\Sigma^v = 0$ .
- (C) One valuation  $v$  such that  $\Sigma^v = 1$ .
- (D) One valuation  $v$  such that  $\Sigma^v = 0$ .

## Disprove a logical consequence

Consider the logical consequence  $\Sigma \models A$ .

To prove that the logical consequence does NOT hold, we need to consider

- (A) Every valuation  $v$  such that  $\Sigma^v = 1$  and  $A^v = 1$ .
- (B) Every valuation  $v$  such that  $\Sigma^v = 1$  and  $A^v = 0$ .
- (C) One valuation  $v$  such that  $\Sigma^v = 1$  and  $A^v = 1$ .
- (D) One valuation  $v$  such that  $\Sigma^v = 1$  and  $A^v = 0$ .

## Example: Prove/Disprove a logical consequence

Consider the logical consequence below.

$$\forall x \neg A(x) \models \neg(\exists x A(x)).$$

If the logical consequence holds, prove it.

If it does not hold, provide a counterexample.

## Example: Prove/Disprove a logical consequence

Consider the logical consequence below.

$$\forall x(A(x) \rightarrow B(x)) \models \forall xA(x) \rightarrow \forall xB(x)$$

If the logical consequence holds, prove it.

If it does not hold, provide a counterexample.

## Example: Prove/Disprove a logical consequence

Consider the logical consequence below.

$$\forall x A(x) \rightarrow \forall x B(x) \models \forall x (A(x) \rightarrow B(x))$$

If the logical consequence holds, prove it.

If it does not hold, provide a counterexample.

## Example: Prove/Disprove the logical consequence

Prove the following

$$\exists x(A(x) \wedge B(x)) \models \exists xA(x) \wedge \exists xB(x).$$

## Example: Prove/Disprove the logical consequence

Prove the following

$$\exists x A(x) \wedge \exists x B(x) \not\models \exists x (A(x) \wedge B(x)).$$

# Revisiting the learning goals

By the end of this lecture, you should be able to:

- ▶ Define logical consequence for predicate logic.
- ▶ Prove that a logical consequence holds.
- ▶ Prove that a logical consequence does not hold.
