

Linear Algebra Review and NumPy Basics¹

Chris J. Maddison

University of Toronto

¹Slides adapted from Ian Goodfellow's *Deep Learning* textbook lectures

About this tutorial

- Not a comprehensive survey of all of linear algebra.
- Focused on the subset most relevant to machine learning.
- Larger subset: e.g., Linear Algebra by Gilbert Strang

- A scalar is a single number
- Integers, real numbers, rational numbers, etc.
- Typically denoted in italic font:

a, n, x

- A vector is an array of d numbers
- x_i be integer, real, binary, etc.
- Notation to denote type and size:

$$\mathbf{x} \in \mathbb{R}^d$$

$$\mathbf{x} = \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_d \end{bmatrix}$$

- A matrix is an array of numbers with two indices
- $A_{i,j}$ be integer, real, binary, etc.
- Notation to denote type and size:

$$A \in \mathbb{R}^{m \times n}$$

$$A = \begin{bmatrix} A_{1,1} & A_{1,2} \\ A_{2,1} & A_{2,2} \end{bmatrix}$$

Matrix (Dot) Product

Matrix product AB is the matrix such that

$$(AB)_{i,j} = \sum_k A_{i,k} B_{k,j}.$$

(Goodfellow 2016)

This also defines matrix-vector products $A\mathbf{x}$ and $\mathbf{x}^T A$.

Identity Matrix

The identity matrix for \mathbb{R}^d is the matrix I_d such that

$$\forall \mathbf{x} \in \mathbb{R}^d, I_d \mathbf{x} = \mathbf{x}$$

For example, I_3 :

$$I_3 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Matrix Transpose

The transpose of a matrix A is the matrix A^\top such that $(A^\top)_{i,j} = A_{j,i}$.

$$A = \begin{bmatrix} A_{1,1} & A_{1,2} \\ A_{2,1} & A_{2,2} \\ A_{3,1} & A_{3,2} \end{bmatrix} \implies A^\top = \begin{bmatrix} A_{1,1} & A_{2,1} & A_{3,1} \\ A_{1,2} & A_{2,2} & A_{3,2} \end{bmatrix}$$

The transpose of a matrix can be thought of as a mirror image across the main diagonal. The transpose switches the order of the matrix product.

$$(AB)^\top = B^\top A^\top$$

Systems of equations

The matrix equation

$$A\mathbf{x} = \mathbf{b}$$

expands to

$$A_{1,1}x_1 + A_{1,2}x_2 + \cdots + A_{1,n}x_n = b_1$$

$$A_{2,1}x_1 + A_{2,2}x_2 + \cdots + A_{2,n}x_n = b_2$$

\vdots

$$A_{m,1}x_1 + A_{m,2}x_2 + \cdots + A_{m,n}x_n = b_m$$

Solving Systems of Equations

A linear system of equations can have:

- No solution
- Many solutions
- Exactly one solution, i.e. multiplying by the matrix is an invertible function

Matrix Inversion

The matrix inverse of A is the matrix A^{-1} such that

$$A^{-1}A = I_d$$

Solving a linear system using an inverse:

$$A\mathbf{x} = \mathbf{b}$$

$$A^{-1}A\mathbf{x} = \mathbf{b}$$

$$I_d\mathbf{x} = A^{-1}\mathbf{b}$$

Can be numerically unstable to implement it this way in the computer, but useful for abstract analysis.

Be careful, the matrix inverse does not always exist. For example, a matrix cannot be inverted if...

- More rows than columns
- More columns than rows
- Rows or columns can be written as linear combinations of other rows or columns (“linearly dependent”)

- A norm is a function that measures how “large” a vector is
- Similar to a distance between zero and the point represented by the vector

$$f(\mathbf{x}) = 0 \implies \mathbf{x} = \mathbf{0}$$

$$f(\mathbf{x} + \mathbf{y}) \leq f(\mathbf{x}) + f(\mathbf{y}) \text{ (the triangle inequality)}$$

$$\forall a \in \mathbb{R}, f(a\mathbf{x}) = |a|f(\mathbf{x})$$

- L^p norm

$$\|\mathbf{x}\|_p = \left(\sum_i |x_i|^p \right)^{\frac{1}{p}}$$

- Most popular norm: L2 norm, $p = 2$, i.e., the Euclidean norm.
- L1 norm:

$$\|\mathbf{x}\|_1 = \sum_i |x_i|$$

- Max norm, infinite norm:

$$\|\mathbf{x}\|_\infty = \max_i |x_i|$$

Special Matrices and Vectors

- Unit vector:

$$\|\mathbf{x}\|_2 = 1$$

- Symmetric matrix:

$$A = A^T$$

- Orthogonal matrix

$$A^T A = A A^T = I_d$$

$$A^T = A^{-1}$$

- The trace of an $n \times n$ matrix is the sum of the diagonal

$$\text{Tr}(A) = \sum_i A_{i,i}$$

- It satisfies some nice commutative properties

$$\text{Tr}(ABC) = \text{Tr}(CAB) = \text{Tr}(BCA)$$

How to learn linear algebra

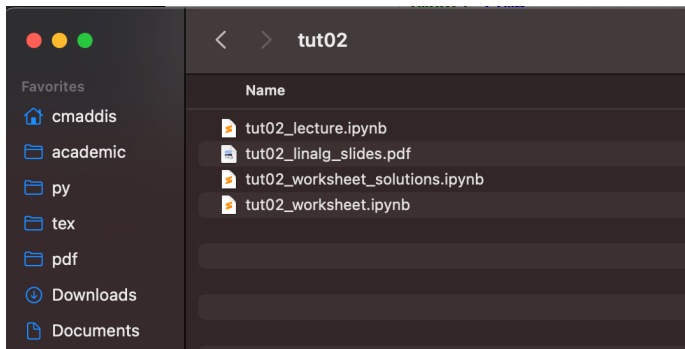

- Lots of practice problems.
- Start writing out things explicitly with summations and individual indexes.
- Eventually you will be able to mostly use matrix and vector product notation quickly and easily.

- NumPy is a software package written for the Python programming language that helps us perform vector-matrix operations very efficiently.
- We will be running through some examples today to get a sense of how to use NumPy.
- First, we will show you how to open a Python Jupyter Notebook in the UofT Jupyter Hub.

This tutorial is completely optional, we do not expect you to be able to use Python Jupyter Notebooks for any assessments.

Python Jupyter Notebooks (.ipynb)

.ipynb files are python scripts that organize code in to runnable cells (will see examples today)

Can run them on UofT Jupyter Hub or Google Colab.

Python Jupyter Notebooks

UofT Jupyter Hub: go to <https://jupyter.utoronto.ca> and log in.

UNIVERSITY OF
TORONTO
JUPYTERHUB

Operated by 2i2c.org

After logging in, open: Jupyter Notebook RStudio JupyterLab

Log in to start

 Use [JupyterHelp](#) to open tickets for support questions.

When you log in, you should see this:

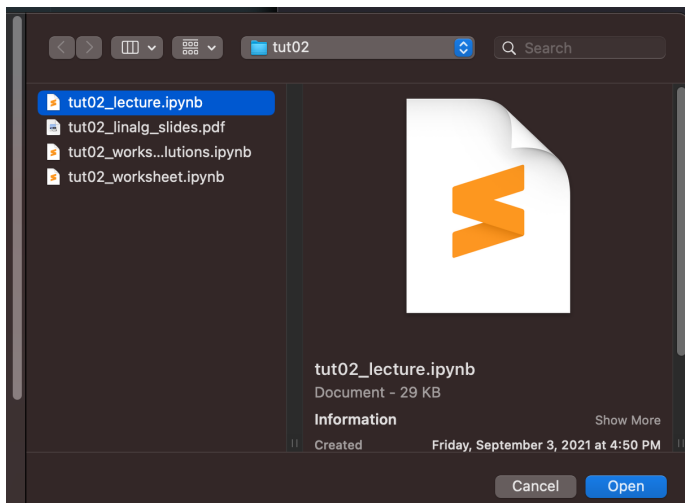

To load a Jupyter Notebook, click on the Upload button:

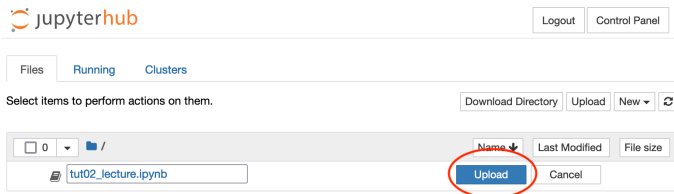

The screenshot shows the JupyterHub interface. At the top left is the JupyterHub logo. To the right are buttons for "Logout" and "Control Panel". Below the logo are tabs for "Files", "Running", and "Clusters". A message says "Select items to perform actions on them." To the right of this message are buttons for "Download Directory", "Upload" (circled in red), "New", and a refresh icon. At the bottom, there is a file list header with columns for "Name", "Last Modified", and "File size". The file list currently shows 0 items.

Python Jupyter Notebooks

You will get a dialog. Select the .ipynb you want and open it:

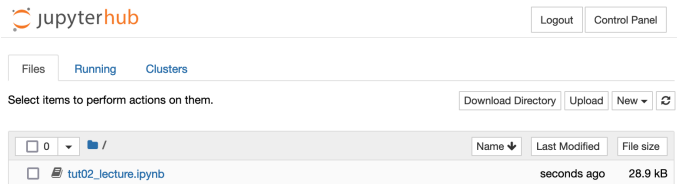

Finally, click the blue Upload button:

The screenshot shows the JupyterHub interface. At the top left is the JupyterHub logo. To the right are 'Logout' and 'Control Panel' buttons. Below the logo are tabs for 'Files', 'Running', and 'Clusters'. A message says 'Select items to perform actions on them.' To the right of this message are buttons for 'Download Directory', 'Upload', 'New', and a refresh icon. Below this is a file browser area with a search bar containing 'tut02_lecture.ipynb'. At the bottom right of the file browser, there is a table with columns 'Name', 'Last Modified', and 'File size'. The 'Name' column contains 'tut02_lecture.ipynb'. To the right of the file name are two buttons: 'Upload' (highlighted with a red circle) and 'Cancel'.

Python Jupyter Notebooks

Now you should have it uploaded!

The screenshot shows the JupyterHub interface. At the top left is the JupyterHub logo. To the right are buttons for "Logout" and "Control Panel". Below the logo are tabs for "Files", "Running", and "Clusters". A message says "Select items to perform actions on them." To the right of this message are buttons for "Download Directory", "Upload", "New", and a refresh icon. Below this is a table with columns for "Name", "Last Modified", and "File size". The table contains one entry: a file named "tut02_lecture.ipynb" with a size of "28.9 kB" and a timestamp of "seconds ago".

jupyterhub

Logout Control Panel

Files Running Clusters

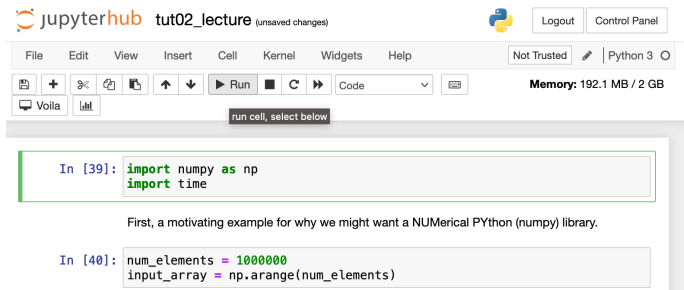

Select items to perform actions on them.

Download Directory Upload New ↕ ↻

	Name ↓	Last Modified	File size
<input type="checkbox"/>	tut02_lecture.ipynb	seconds ago	28.9 kB

Python Jupyter Notebooks

Click on the link to open the Notebook.

The screenshot shows a Jupyter Notebook interface. At the top, the JupyterHub logo is on the left, followed by the notebook name "tut02_lecture" and "(unsaved changes)". On the right, there are "Logout" and "Control Panel" buttons. Below this is a menu bar with "File", "Edit", "View", "Insert", "Cell", "Kernel", "Widgets", and "Help". To the right of the menu bar, it says "Not Trusted" and "Python 3". Below the menu bar is a toolbar with various icons for file operations, a "Run" button, a "Code" dropdown menu, and a "Memory: 192.1 MB / 2 GB" indicator. A "Voila" button is also visible. A tooltip "run cell, select below" is shown over the "Run" button. The notebook content consists of two code cells and a text block. The first code cell (In [39]) contains the code:

```
import numpy as np
import time
```

. Below this code cell is a text block: "First, a motivating example for why we might want a NUMerical PYthon (numpy) library." The second code cell (In [40]) contains the code:

```
num_elements = 1000000
input_array = np.arange(num_elements)
```

Now we will show you how to run things.
