

# STA314 Midterm Review

# Midterm Review

1. A brief overview
2. Some past midterm questions  
(Note: midterm will be on Quercus  
and *probably* multiple choice)

- **Supervised learning and Unsupervised learning**

Supervised learning: have a collection of training examples labeled with the correct outputs

Unsupervised learning: have no labeled examples

- **Regression and Classification**

Regression: predicting a scalar-valued target

Classification: predicting a discrete-valued target

- **K-Nearest Neighbors**

Idea: Classify a new input  $\mathbf{x}$  based on its  $k$  nearest neighbors in the training set

Decision boundary: the boundary between regions of input space assigned to different categories

Tradeoffs in choosing  $k$ : overfit / underfit

Pitfalls: curse of dimensionality, normalization, computational cost

- **Linear Regression**

Model: a linear function of the features  $y = \mathbf{w}^\top \mathbf{x} + b$

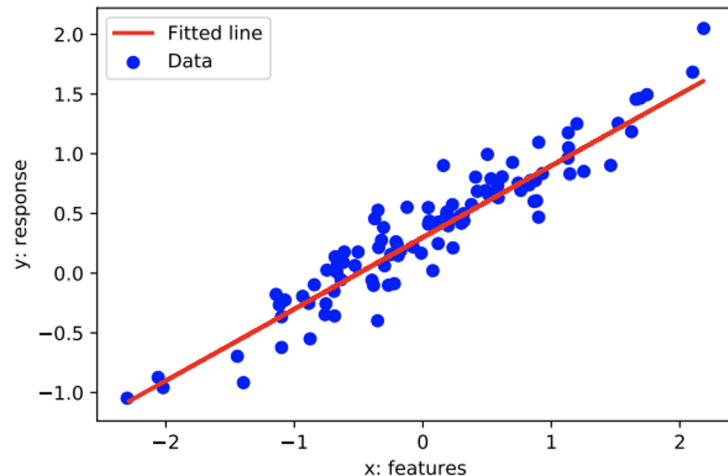

Loss function: squared error loss  $\mathcal{L}(y, t) = \frac{1}{2}(y - t)^2$

Cost function: loss function averaged over all training examples

Vectorization: advantages

Solving minimization problem: direct solution / gradient descent  $\mathbf{w} \leftarrow \mathbf{w} - \alpha \frac{\partial \mathcal{J}}{\partial \mathbf{w}}$

Feature mapping: degree-M polynomial feature mapping

- **Model Complexity and Generalization**

Underfitting: too simplistic to describe the data

Overfitting: too complex, fit training examples perfectly, but fails to generalize to unseen data

Hyperparameter: can't include in the training procedure itself, tune it using a validation set

Regularization:  $\mathcal{J}_{\text{reg}}(\mathbf{w}) = \mathcal{J}(\mathbf{w}) + \lambda\mathcal{R}(\mathbf{w})$ , improve the generalization, L2 / L1 regularization

# Linear Classification

## Binary Linear Classification

Model:  $z = \mathbf{w}^\top \mathbf{x}$

$$y = \begin{cases} 1 & \text{if } z \geq 0 \\ 0 & \text{if } z < 0 \end{cases}$$

Geometry: input space, weight space

Loss function: 0-1 loss  $\mathcal{L}_{0-1}(y, t) = \begin{cases} 0 & \text{if } y = t \\ 1 & \text{if } y \neq t \end{cases}$   
 $= \mathbb{I}[y \neq t]$

$$w_0 \geq 0$$

$$w_0 + w_1 < 0$$

## Logistic Regression

Model:  $z = \mathbf{w}^\top \mathbf{x}$

$$y = \sigma(z)$$

Loss function: 0-1 loss

→ squared error loss  $\mathcal{L}_{SE}(z, t) = \frac{1}{2}(z - t)^2$

→ logistic + squared error loss  $\mathcal{L}_{SE}(y, t) = \frac{1}{2}(y - t)^2$

→ logistic + cross-entropy loss  $\mathcal{L}_{CE} = -t \log y - (1 - t) \log(1 - y)$

## Softmax Regression

Multi-class classification

$$y_k = \text{softmax}(z_1, \dots, z_K)_k = \frac{e^{z_k}}{\sum_{k'} e^{z_{k'}}$$

$$\mathbf{z} = \mathbf{W}\mathbf{x}$$

$$\mathbf{y} = \text{softmax}(\mathbf{z})$$

$$\mathcal{L}_{CE} = -\mathbf{t}^\top (\log \mathbf{y})$$

- **Decision Trees**

Model: make predictions by splitting on features according to a tree structure

Decision boundary: made up of axis-aligned planes

Entropy: uncertainty inherent in the variable's possible outcomes  $H(Y) = - \sum_{y \in Y} p(y) \log_2 p(y)$

joint entropy; conditional entropy; properties

Information gain:  $IG(Y|X) = H(Y) - H(Y|X)$

measures the informativeness of a variable; used to choose a good split

# Other topics to know

- Comparisons between different classifiers (KNN, logistic regression, decision trees, neural networks)
- Contrast the decision boundaries for different classifiers

## 2018 Midterm Version A Q7

7. [2pts] Consider the classification problem with the following dataset:

| $x_1$ | $x_2$ | $x_3$ | $t$ |
|-------|-------|-------|-----|
| 0     | 0     | 0     | 1   |
| 0     | 1     | 0     | 0   |
| 0     | 1     | 1     | 1   |
| 1     | 1     | 1     | 0   |

Your job is to find a linear classifier with weights  $w_1$ ,  $w_2$ ,  $w_3$ , and  $b$  which correctly classifies all of these training examples. None of the examples should lie on the decision boundary.

- (a) [1pt] Give the set of linear inequalities the weights and bias must satisfy.
- (b) [1pt] Give a setting of the weights and bias that correctly classifies all the training examples. You don't need to show your work, but it might help you get partial credit.

## Solution

| $x_1$ | $x_2$ | $x_3$ | $t$ |
|-------|-------|-------|-----|
| 0     | 0     | 0     | 1   |
| 0     | 1     | 0     | 0   |
| 0     | 1     | 1     | 1   |
| 1     | 1     | 1     | 0   |

$$t = 1, w_1x_1 + w_2x_2 + w_3x_3 + b \geq 0$$

$$t = 0, w_1x_1 + w_2x_2 + w_3x_3 + b < 0$$

Many answers are possible.  
Here's one:

$$\begin{cases} w_1 \cdot 0 + w_2 \cdot 0 + w_3 \cdot 0 + b > 0 \\ w_1 \cdot 0 + w_2 \cdot 1 + w_3 \cdot 0 + b < 0 \\ w_1 \cdot 0 + w_2 \cdot 1 + w_3 \cdot 1 + b > 0 \\ w_1 \cdot 1 + w_2 \cdot 1 + w_3 \cdot 1 + b < 0 \end{cases} \implies \begin{cases} b > 0 & b = 1 \\ w_2 + b < 0 & w_1 = -2 \\ w_2 + w_3 + b > 0 & w_2 = -2 \\ w_1 + w_2 + w_3 + b < 0 & w_3 = 2 \end{cases}$$

## 2018 Midterm Version B Q7

7. [2pts] Suppose binary-valued random variables  $X$  and  $Y$  have the following joint distribution:

|         | $Y = 0$ | $Y = 1$ |
|---------|---------|---------|
| $X = 0$ | $1/8$   | $3/8$   |
| $X = 1$ | $2/8$   | $2/8$   |

Determine the information gain  $IG(Y|X)$ . You may write your answer as a sum of logarithms.

## Solution

|         | $Y = 0$ | $Y = 1$ |
|---------|---------|---------|
| $X = 0$ | $1/8$   | $3/8$   |
| $X = 1$ | $2/8$   | $2/8$   |

$$p(Y = 0) = p(X = 0, Y = 0) + p(X = 1, Y = 0) = \frac{3}{8}$$

$$p(Y = 1) = p(X = 0, Y = 1) + p(X = 1, Y = 1) = \frac{5}{8}$$

$$p(X = 0) = p(X = 0, Y = 0) + p(X = 0, Y = 1) = \frac{1}{2}$$

$$p(X = 1) = p(X = 1, Y = 0) + p(X = 1, Y = 1) = \frac{1}{2}$$

$$\begin{aligned} p(Y = 0|X = 0) &= \frac{p(Y = 0, X = 0)}{p(X = 0)} \\ &= \frac{p(Y = 0, X = 0)}{p(X = 0, Y = 0) + p(X = 0, Y = 1)} \\ &= \frac{1}{4} \end{aligned}$$

We used:  $p(y|x) = \frac{p(x,y)}{p(x)}$  and  $p(x) = \sum_y p(x,y)$

$$IG(Y|X) = H(Y) - H(Y|X)$$

$$\begin{aligned} H(Y) &= \boxed{-} \sum_y p(Y = y) \log_2 p(Y = y) \\ &= -p(Y = 0) \log_2 p(Y = 0) - p(Y = 1) \log_2 p(Y = 1) \\ &= -\frac{3}{8} \log_2 \frac{3}{8} - \frac{5}{8} \log_2 \frac{5}{8} \end{aligned}$$

$$\begin{aligned} H(Y|X) &= \sum_x p(X = x) H(Y|X = x) \\ &= p(X = 0) H(Y|X = 0) + p(X = 1) H(Y|X = 1) \\ &= \frac{1}{2} H(Y|X = 0) + \frac{1}{2} H(Y|X = 1) \end{aligned}$$

$$H(Y|X = x) = \boxed{-} \sum_y p(y|x) \log_2 p(y|x)$$

$$\begin{aligned} H(Y|X = 0) &= -p(Y = 0|X = 0) \log_2 p(Y = 0|X = 0) \\ &\quad - p(Y = 1|X = 0) \log_2 p(Y = 1|X = 0) \\ &= -\frac{1}{4} \log_2 \frac{1}{4} - \frac{3}{4} \log_2 \frac{3}{4} \end{aligned}$$

$$H(Y|X = 1) = -\frac{1}{2} \log_2 \frac{1}{2} - \frac{1}{2} \log_2 \frac{1}{2}$$
