A3 Q1 Clarification #126

Ŧ	*	0	117
UNPIN	STAR	WATCHING	VIEWS

Hi all,

For the Laplacian of Gaussian filter in A3 Question 1, you should be sure to use the *normalized* version of this filter so that the response at different scales is consistent. See the below image, which illustrates the difference. More information can be found on these slides

(http://cubs.buffalo.edu/~inwogu/teaching/Coursepage573_fa14/lectures/12LocalFeatures_contd.pdf)

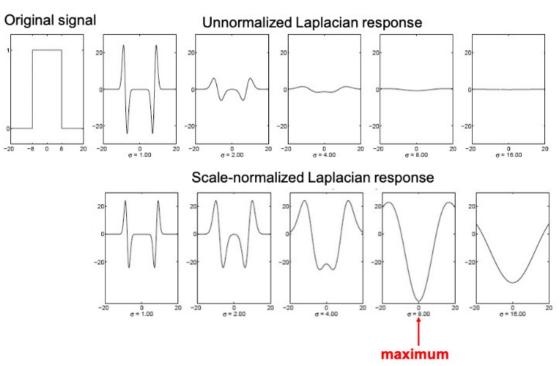

More specifically, you should use this equation, but add a scale factor of σ^2 to compute the normalized Laplacian of Gaussian filter (this results in a factor of $1/\sigma^2$ in the denominator at the front of the expression).

· Laplacian of Gaussian: We mentioned it for edge detection

$$\nabla_{g}^{2}(x, y, \sigma) = -\frac{1}{\pi\sigma^{4}} \left(1 - \frac{x^{2} + y^{2}}{2\sigma^{2}} \right) \exp -\frac{x^{2} + y^{2}}{2\sigma^{2}}$$

Effect of scale normalization

Overview

- Motivation: image matching, panoramas
- What is a homography?
- computing homographies
- Random sample consensus (RANSAC)

Recap from last time

- Now we know how to extract scale and rotation invariant features
- We even know how to match features across images
- Can we use this to find Waldo in an even more sneaky scenario?

Someone takes a (weird) picture of him!

Find My DVD!

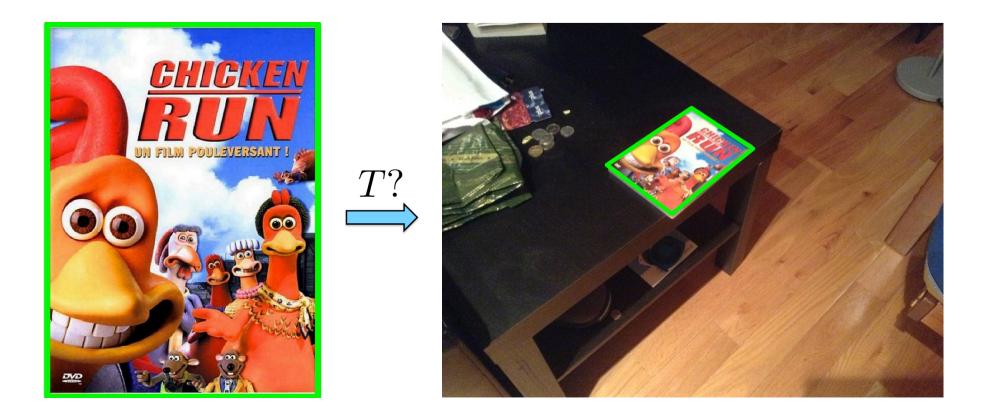

• More interesting: If we have DVD covers (e.g., from Amazon), can we match them to DVDs in real scenes?

What Transformation Happened To My DVD?

• Rectangle goes to a parallelogram

Affine Transformations

Affine transformations are combinations of

• Linear transformations, and translations

$$\begin{bmatrix} x'\\y' \end{bmatrix} = \begin{bmatrix} a & b & e\\c & d & f \end{bmatrix} \begin{bmatrix} x\\y\\1 \end{bmatrix}$$

- Properties of affine transformations:
 - Origin does not necessarily map to origin
 - Lines map to lines
 - Parallel lines remain parallel
 - Ratios are preserved
 - Closed under composition
- Rectangles go to parallelograms

[Source: N. Snavely, slide credit: R. Urtasun]

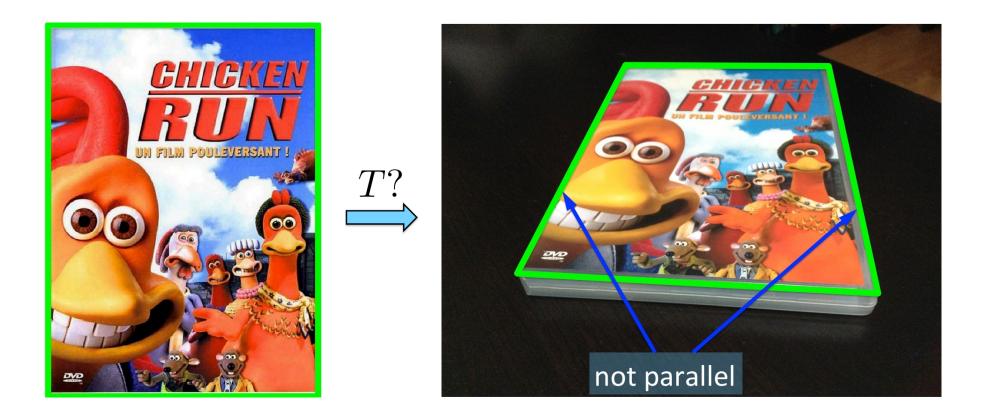

What Transformation Happened To My DVD?

• Is this an affine transformation?

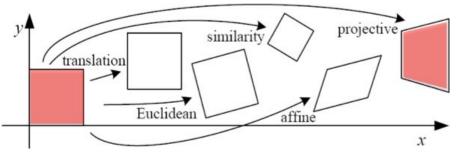

What Transformation Happened To My DVD?

• Actually, a rectangle, maps to quadrilateral

2D Image Transformations

Transformation	Matrix	# DoF	Preserves	Icon
translation	$\left[egin{array}{c c} I & t \end{array} ight]_{2 imes 3}$	2	orientation	
rigid (Euclidean)	$\left[egin{array}{c c} R & t \end{array} ight]_{2 imes 3}$	3	lengths	\bigcirc
similarity	$\left[\left. {_{S} R} \right t \left. ight]_{2 imes 3} ight.$	4	angles	\bigcirc
affine	$\left[egin{array}{c} A \end{array} ight]_{2 imes 3}$	6	parallelism	
projective	$\left[egin{array}{c} ilde{H} \end{array} ight]_{3 imes 3}$	8	straight lines	

- These transformations are a nested set of groups
- Closed under composition and inverse is a member

[source: R. Szeliski]

Projective Transformations

• Homography
$$a \begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

- Properties:
 - Origin does not necessarily map to origin
 - Lines map to lines
 - Parallel lines do not necessarily remain parallel
 - Ratios are not preserved
 - Closed under composition
 - Rectangle goes to quadrilateral
 - •Affine transformation is a special case, where g = h = 0 and i = 1

[Source: N. Snavely, slide credit: R. Urtasun]

What Transformation Happened To My DVD?

For planar objects:

- Viewpoint change for planar objects is a homography
- Affine transformation approximates viewpoint change for planar objects that are far away from camera

- Why should I care about homography?
- Now that I care, how should I estimate it?
- I want to understand the geometry behind homography. That is, why aren't parallel lines mapped to parallel lines in oblique viewpoints? How did we get that equation for computing the homography?

- Why should I care about homography? Let's answer this first
- Now that I care, how should I estimate it?
- I want to understand the geometry behind homography. That is, why aren't parallel lines mapped to parallel lines in oblique viewpoints? How did we get that equation for computing the homography?

•Why do we need homography? Can't we just assume that the transformation is affine? The approximation on the right looks pretty decent to me...

- •Why do we need homography? Can't we just assume that the transformation is affine? The approximation on the right looks pretty decent to me...
- That's right. If I want to detect (match) an object in a new viewpoint, an affine transformation is a relatively decent approximation

- •Why do we need homography? Can't we just assume that the transformation is affine? The approximation on the right looks pretty decent to me...
- That's right. If I want to detect (match) an object in a new viewpoint, an affine transformation is a relatively decent approximation
- But for some applications I want to be more accurate. Which?

• Tom Cruise is taking an exam on Monday

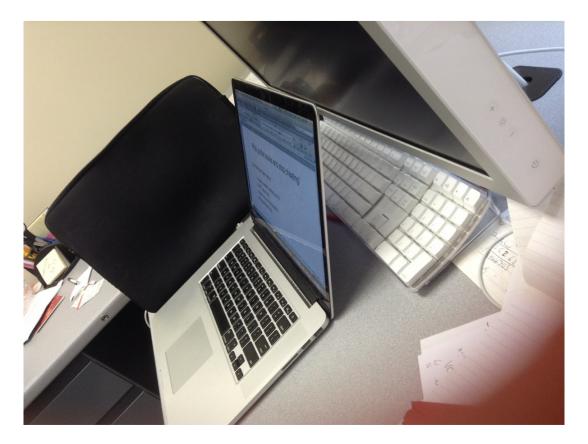

exam is here

• The professor keeps the exams in this office

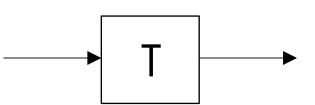

• He enters (without permission) and takes a picture of the laptop screen

- His picture turns out to not be from a viewpoint he was shooting for (it's difficult to take pictures while hanging)
- Can he still read the exam?

Warping an Image with a Global Transformation

P' = (x', y')

- p= (x,y)
- Transformation 7 is a coordinate-changing machine:
 - [x', y'] = T(x, y)
- What does it mean that T is global?
 - Is the same for any point p
 - Can be described by just a few numbers (parameters)

[Source: N. Snavely, slide credit: R. Urtasun]

Warping an Image with a Global Transformation

• Example of warping for different transformations:

translation

rotation

```
aspect
```

affine

perspective

Forward and Inverse Warping

•Forward Warping: Send each pixel f(x) to its corresponding location (x', y') = T(x, y) in g(x', y')

procedure forwardWarp(f, h, out g):

For every pixel x in f(x)

- 1. Compute the destination location x' = h(x).
- 2. Copy the pixel f(x) to g(x').

Forward and Inverse Warping

•Forward Warping: Send each pixel f(x) to its corresponding location (x', y') = T(x, y) in g(x', y')

procedure forwardWarp(f, h, out g):

For every pixel x in f(x)

1. Compute the destination location x' = h(x).

2. Copy the pixel f(x) to g(x').

• May leave some holes in the target image.

Forward and Inverse Warping

•Forward Warping: Send each pixel f(x) to its corresponding location (x', y') = T(x, y) in g(x', y')

```
procedure forwardWarp(f, h, out g):
```

```
For every pixel x in f(x)
```

```
1. Compute the destination location x' = h(x).
```

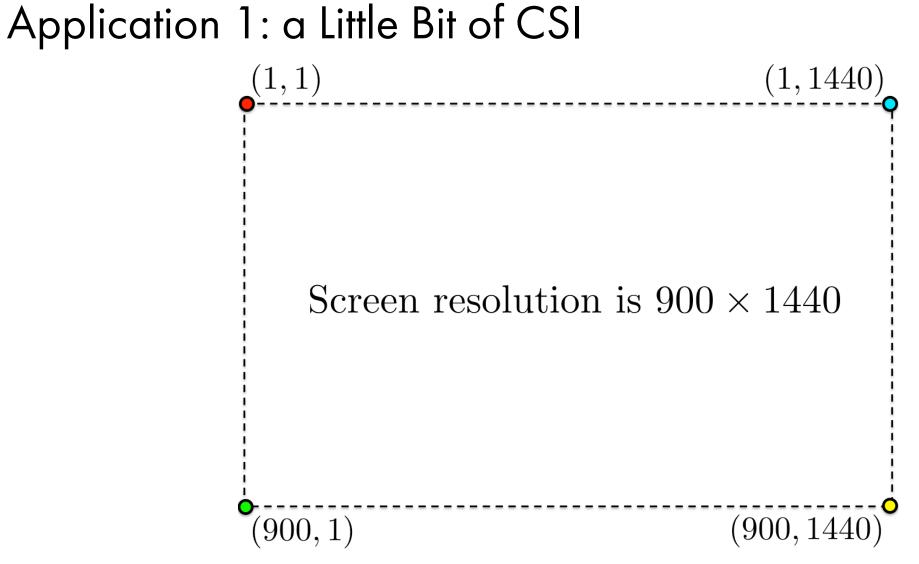

```
2. Copy the pixel f(x) to g(x').
```

- May leave some holes in the target image.
- Inverse Warping: Each pixel at destination is sampled from original image

```
procedure inverseWarp(f, h, out g):
For every pixel x' in g(x')
1. Compute the source location x = ĥ(x')
2. Resample f(x) at location x and copy to g(x')
```

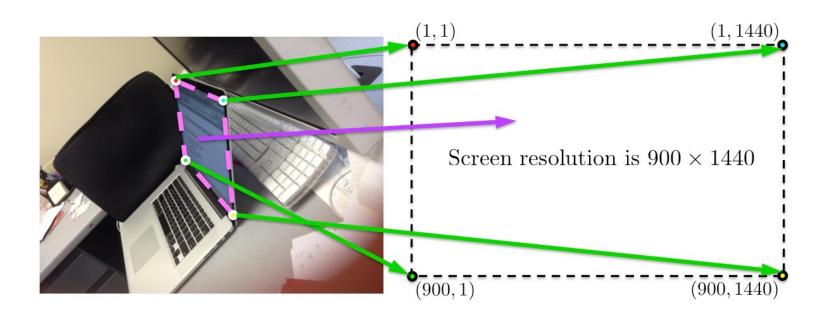

• We want to transform the picture (plane) inside these 4 points into a rectangle (laptop screen)

• We want it to look like this. How can we do this?

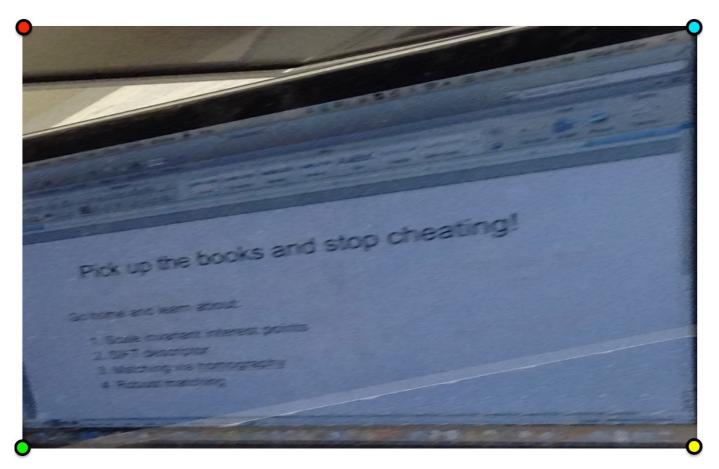

• A transformation that maps a projective plane (a quadrilateral) to another projective plane (another quadrilateral, in this case a rectangle) is a homography

homography H

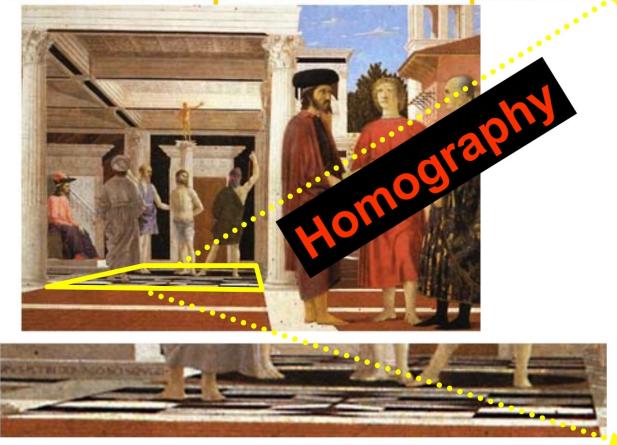

Pick up the books and stop cheating! 174 X1. 42 X1.2

• If we compute the homography and warp the image according to it, we get this

• If we used affine transformation instead, we'd get this. Would be even worse if our picture was taken closer to the laptop

What is the shape of the b/w floor pattern?

Holbein, "The Ambassadors"

DIY: use a polished spoon to see the skull

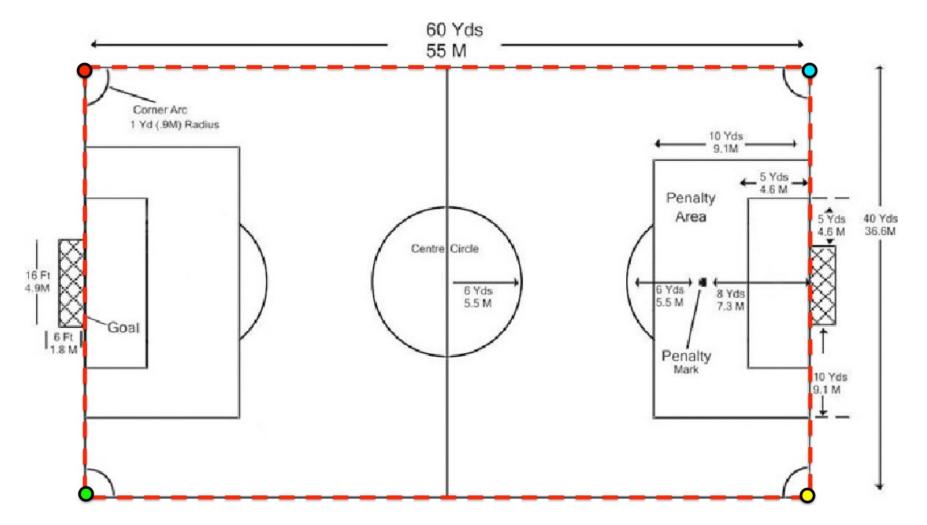

• How many meters did this player run?

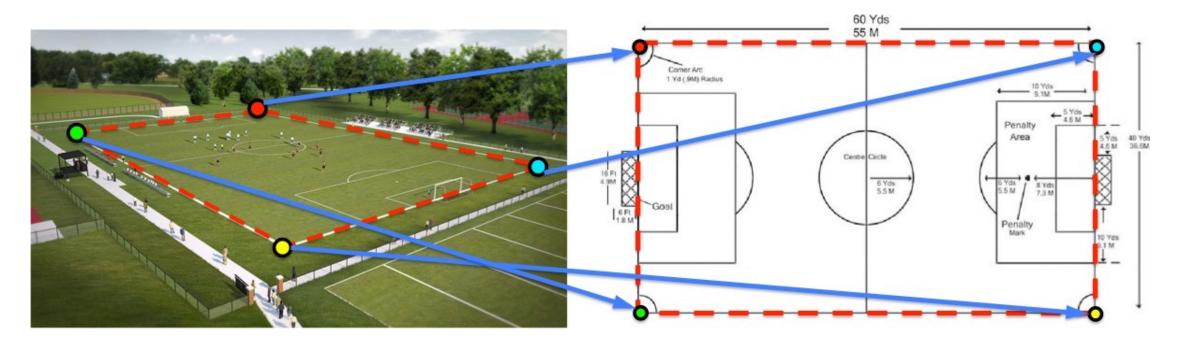

• Field is planar. We know its dimensions (look on Wikipedia).

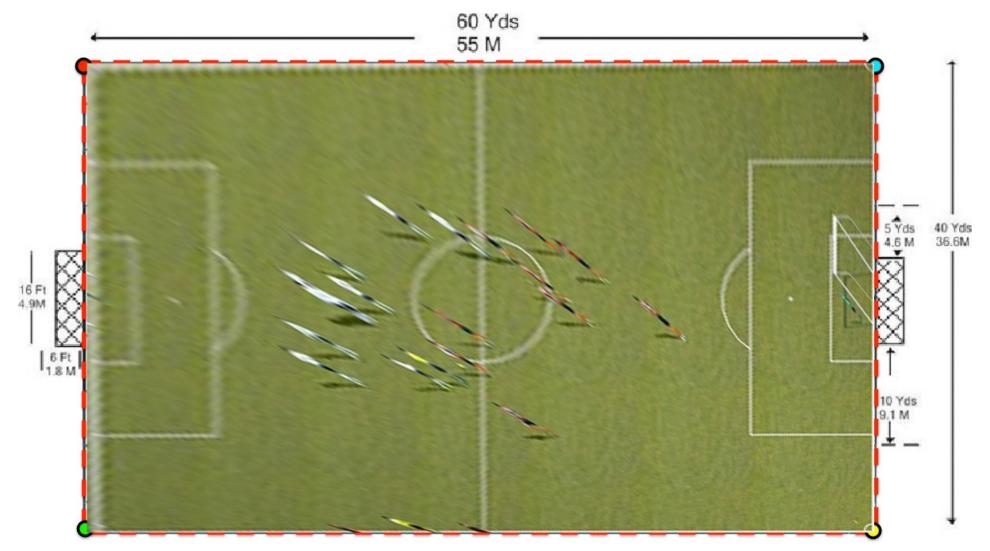

• Let's take the 4 corner points of the field

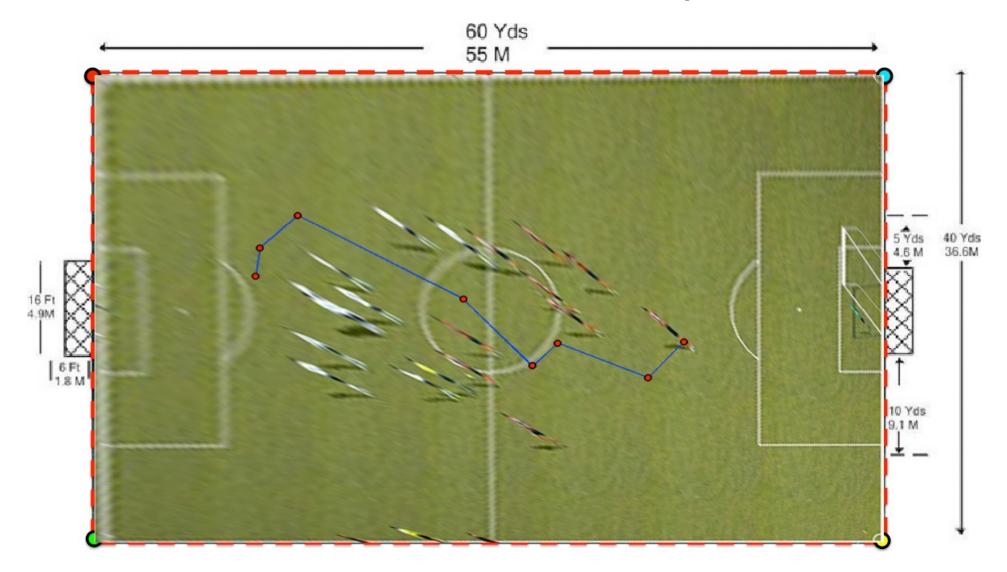

• We need to compute a homography that maps them to these 4 corners

• We need to compute a homography that maps the 4 corners. Any other point from this plane (the field) also maps to the right with the same homography

• Nice. What happened to the players?

• We can now also transform the player's trajectory \rightarrow and we have it in meters!

• If we used affine transformation... Our estimations of running would not be accurate!

Application 4: Panorama Stitching

Take a tripod, rotate camera and take pictures

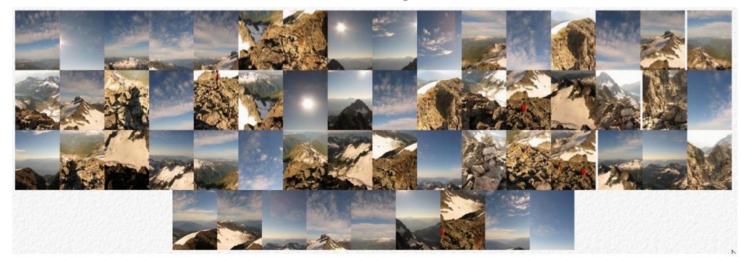

[Source: Fernando Flores-Mangas]

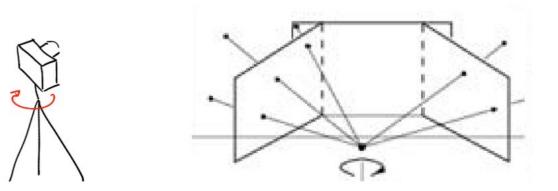

Application 4: Panorama Stitching

[Source: Fernando Flores-Mangas]

Application 4: Panorama Stitching

 Each pair of images is related by homography! If we also moved the camera, this wouldn't be true (next class)

[Source: Fernando Flores-Mangas]

We can use homographies when...

• The scene is planar

• The scene is relatively far off or has small (relative) depth variation (i.e., scene is approximately planar

We can use homographies when...

• The scene is captured under camera rotation only (no translation or pose change)

Homography

- Why should I care about homography?
- Now that I care, how should I estimate it? Let's do this now
- I want to understand the geometry behind homography. That is, why aren't parallel lines mapped to parallel lines in oblique viewpoints? How did we get that equation for computing the homography?

- Projective mapping between any two projection planes with the same centre of projection
- •Let (x_i, y_i) be a point on the reference (model) image, and (x'_i, y'_i) its match in the test image •A homography H maps (x_i, y_i) to (x'_i, y'_i) :

$$\begin{bmatrix} ax_i' \\ ay_i' \\ a \end{bmatrix} = \begin{bmatrix} h_{00} & h_{01} & h_{02} \\ h_{10} & h_{11} & h_{12} \\ h_{20} & h_{21} & h_{22} \end{bmatrix} \begin{bmatrix} x_i \\ y_i \\ 1 \end{bmatrix}$$

- Projective mapping between any two projection planes with the same centre of projection
- •Let (x_i, y_i) be a point on the reference (model) image, and (x'_i, y'_i) its match in the test image •A homography H maps (x_i, y_i) to (x'_i, y'_i) :

$$\begin{bmatrix} ax_i' \\ ay_i' \\ a \end{bmatrix} = \begin{bmatrix} h_{00} & h_{01} & h_{02} \\ h_{10} & h_{11} & h_{12} \\ h_{20} & h_{21} & h_{22} \end{bmatrix} \begin{bmatrix} x_i \\ y_i \\ 1 \end{bmatrix}$$

• Expand matrix multiplication

$$ax_{i}' = h_{00}x_{i} + h_{01}y_{i} + h_{02}$$

$$ay_{i}' = h_{10}x_{i} + h_{11}y_{i} + h_{12}$$

$$a = h_{20}x_{i} + h_{21}y_{i} + h_{22}$$

- Projective mapping between any two projection planes with the same centre of projection
- Let (x_i, y_i) be a point on the reference (model) image, and (x'_i, y'_i) its match in the test image • A homography H maps (x_i, y_i) to (x'_i, y'_i) :

$$\begin{bmatrix} ax_i' \\ ay_i' \\ a \end{bmatrix} = \begin{bmatrix} h_{00} & h_{01} & h_{02} \\ h_{10} & h_{11} & h_{12} \\ h_{20} & h_{21} & h_{22} \end{bmatrix} \begin{bmatrix} x_i \\ y_i \\ 1 \end{bmatrix}$$

• Expand matrix multiplication

$$ax_{i}' = h_{00}x_{i} + h_{01}y_{i} + h_{02}$$

$$ay_{i}' = h_{10}x_{i} + h_{11}y_{i} + h_{12}$$

$$a = h_{20}x_{i} + h_{21}y_{i} + h_{22}$$

• Divide out scale factor

$$x_{i}' = \frac{h_{00}x_{i} + h_{01}y_{i} + h_{02}}{h_{20}x_{i} + h_{21}y_{i} + h_{22}} \qquad \qquad y_{i}' = \frac{h_{10}x_{i} + h_{11}y_{i} + h_{12}}{h_{20}x_{i} + h_{21}y_{i} + h_{22}}$$

- Projective mapping between any two projection planes with the same centre of projection
- Let (x_i, y_i) be a point on the reference (model) image, and (x'_i, y'_i) its match in the test image • A homography H maps (x_i, y_i) to (x'_i, y'_i) :

$$\begin{bmatrix} ax_i' \\ ay_i' \\ a \end{bmatrix} = \begin{bmatrix} h_{00} & h_{01} & h_{02} \\ h_{10} & h_{11} & h_{12} \\ h_{20} & h_{21} & h_{22} \end{bmatrix} \begin{bmatrix} x_i \\ y_i \\ 1 \end{bmatrix}$$

• Expand matrix multiplication

$$ax_{i}' = h_{00}x_{i} + h_{01}y_{i} + h_{02}$$

$$ay_{i}' = h_{10}x_{i} + h_{11}y_{i} + h_{12}$$

$$a = h_{20}x_{i} + h_{21}y_{i} + h_{22}$$

Can I rewrite this into a linear system in h?

• Divide out scale factor

$$x_{i}' = \frac{h_{00}x_{i} + h_{01}y_{i} + h_{02}}{h_{20}x_{i} + h_{21}y_{i} + h_{22}} \qquad \qquad y_{i}' = \frac{h_{10}x_{i} + h_{11}y_{i} + h_{12}}{h_{20}x_{i} + h_{21}y_{i} + h_{22}}$$

•From:
$$x_i' = \frac{h_{00}x_i + h_{01}y_i + h_{02}}{h_{20}x_i + h_{21}y_i + h_{22}}$$
 $y_i' = \frac{h_{10}x_i + h_{11}y_i + h_{12}}{h_{20}x_i + h_{21}y_i + h_{22}}$

•We can easily get this:

$$x_i'(h_{20}x_i + h_{21}y_i + h_{22}) = h_{00}x_i + h_{01}y_i + h_{02}$$
$$y_i'(h_{20}x_i + h_{21}y_i + h_{22}) = h_{10}x_i + h_{11}y_i + h_{12}$$

•From:
$$x_i' = \frac{h_{00}x_i + h_{01}y_i + h_{02}}{h_{20}x_i + h_{21}y_i + h_{22}}$$
 $y_i' = \frac{h_{10}x_i + h_{11}y_i + h_{12}}{h_{20}x_i + h_{21}y_i + h_{22}}$

•We can easily get this:

$$x_i'(h_{20}x_i + h_{21}y_i + h_{22}) = h_{00}x_i + h_{01}y_i + h_{02}$$
$$y_i'(h_{20}x_i + h_{21}y_i + h_{22}) = h_{10}x_i + h_{11}y_i + h_{12}$$

• Rewriting it a little:

$$h_{00}x_i + h_{01}y_i + h_{02} - x_i'(h_{20}x_i + h_{21}y_i + h_{22}) = 0$$

$$h_{10}x_i + h_{11}y_i + h_{12} - y_i'(h_{20}x_i + h_{21}y_i + h_{22}) = 0$$

•We can re-write these equations:

$$h_{00}x_i + h_{01}y_i + h_{02} - x_i'(h_{20}x_i + h_{21}y_i + h_{22}) = 0$$

$$h_{10}x_i + h_{11}y_i + h_{12} - y_i'(h_{20}x_i + h_{21}y_i + h_{22}) = 0$$

•As a linear system:

$$\begin{bmatrix} x_i & y_i & 1 & 0 & 0 & 0 & -x_i'x_i & -x_i'y_i & -x_i' \\ 0 & 0 & 0 & x_i & y_i & 1 & -y_i'x_i & -y'y_i & -y_i' \end{bmatrix} \begin{bmatrix} h_{00} \\ h_{01} \\ h_{02} \\ h_{10} \\ h_{11} \\ h_{12} \\ h_{20} \\ h_{21} \\ h_{22} \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Exact case

• If we have exactly 4 matches, this gives 8 equations (how many columns?)

$$\begin{bmatrix} x_{1} & y_{1} & 1 & 0 & 0 & 0 & -x_{1}'x_{1} & -x_{1}'y_{1} & -x_{1}' \\ 0 & 0 & 0 & x_{1} & y_{1} & 1 & -y_{1}'x_{1} & -y_{1}'y_{1} & -y_{1}' \\ \vdots & & \vdots & & \\ x_{n} & y_{n} & 1 & 0 & 0 & 0 & -x_{n}'x_{n} & -x_{n}'y_{n} & -x_{n}' \\ 0 & 0 & 0 & x_{n} & y_{n} & 1 & -y_{n}'x_{n} & -y_{n}'y_{n} & -y_{n}' \end{bmatrix} \begin{bmatrix} h_{00} \\ h_{01} \\ h_{02} \\ h_{10} \\ h_{11} \\ h_{12} \\ h_{20} \\ h_{21} \\ h_{22} \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$M$$

9

• Are the columns linearly dependent or independent?

Exact case

• If we have exactly 4 matches, this gives 8 equations (how many columns?)

$$\begin{bmatrix} x_{1} & y_{1} & 1 & 0 & 0 & 0 & -x_{1}'x_{1} & -x_{1}'y_{1} & -x_{1}' \\ 0 & 0 & 0 & x_{1} & y_{1} & 1 & -y_{1}'x_{1} & -y_{1}'y_{1} & -y_{1}' \\ \vdots & & & \vdots & & & \\ x_{n} & y_{n} & 1 & 0 & 0 & 0 & -x_{n}'x_{n} & -x_{n}'y_{n} & -x_{n}' \\ 0 & 0 & 0 & x_{n} & y_{n} & 1 & -y_{n}'x_{n} & -y_{n}'y_{n} & -y_{n}' \end{bmatrix} \begin{bmatrix} n_{01} \\ h_{02} \\ h_{10} \\ h_{11} \\ h_{12} \\ h_{20} \\ h_{21} \\ h_{22} \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 1 \\ 0 \\ 2n \end{bmatrix}$$

 $[h_{00}]$

- Are the columns linearly dependent or independent?
- Is there a null space?

Exact case

• If we have exactly 4 matches, this gives 8 equations (how many columns?)

$$\begin{bmatrix} x_{1} & y_{1} & 1 & 0 & 0 & 0 & -x_{1}'x_{1} & -x_{1}'y_{1} & -x_{1}' \\ 0 & 0 & 0 & x_{1} & y_{1} & 1 & -y_{1}'x_{1} & -y_{1}'y_{1} & -y_{1}' \\ \vdots & & & \vdots & & & \\ x_{n} & y_{n} & 1 & 0 & 0 & 0 & -x_{n}'x_{n} & -x_{n}'y_{n} & -x_{n}' \\ 0 & 0 & 0 & x_{n} & y_{n} & 1 & -y_{n}'x_{n} & -y_{n}'y_{n} & -y_{n}' \end{bmatrix} \begin{bmatrix} n_{01} \\ h_{02} \\ h_{10} \\ h_{11} \\ h_{12} \\ h_{20} \\ h_{21} \\ h_{22} \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ h_{21} \\ h_{22} \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ h_{21} \\ h_{22} \end{bmatrix}$$

[*h*₀₀]

- Are the columns linearly dependent or independent?
- Is there a null space?
- How does this relate to the homography?

• Taking all matches into account:

$$\begin{bmatrix} x_{1} & y_{1} & 1 & 0 & 0 & 0 & -x_{1}'x_{1} & -x_{1}'y_{1} & -x_{1}' \\ 0 & 0 & 0 & x_{1} & y_{1} & 1 & -y_{1}'x_{1} & -y_{1}'y_{1} & -y_{1}' \\ & & & \vdots \\ x_{n} & y_{n} & 1 & 0 & 0 & 0 & -x_{n}'x_{n} & -x_{n}'y_{n} & -x_{n}' \\ 0 & 0 & 0 & x_{n} & y_{n} & 1 & -y_{n}'x_{n} & -y_{n}'y_{n} & -y_{n}' \end{bmatrix} \begin{bmatrix} h_{00} \\ h_{01} \\ h_{02} \\ h_{10} \\ h_{11} \\ h_{12} \\ h_{20} \\ h_{21} \\ h_{22} \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 1 \\ 0 \\ 2n \end{bmatrix} \begin{bmatrix} 0 \\ 0 \\ 2n \end{bmatrix}$$

• Taking all matches into account:

$$\begin{bmatrix} x_{1} & y_{1} & 1 & 0 & 0 & 0 & -x_{1}'x_{1} & -x_{1}'y_{1} & -x_{1}' \\ 0 & 0 & 0 & x_{1} & y_{1} & 1 & -y_{1}'x_{1} & -y_{1}'y_{1} & -y_{1}' \\ \vdots & & \vdots & & \\ x_{n} & y_{n} & 1 & 0 & 0 & 0 & -x_{n}'x_{n} & -x_{n}'y_{n} & -x_{n}' \\ 0 & 0 & 0 & x_{n} & y_{n} & 1 & -y_{n}'x_{n} & -y_{n}'y_{n} & -y_{n}' \end{bmatrix} \begin{bmatrix} h_{00} \\ h_{01} \\ h_{02} \\ h_{10} \\ h_{11} \\ h_{12} \\ h_{20} \\ h_{21} \\ h_{22} \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ h_{21} \\ h_{22} \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ h_{21} \\ h_{22} \end{bmatrix}$$

9

• Can be written as a least squares problem $\min_{h} ||Ah||_2^2$

• Taking all matches into account:

$$\begin{bmatrix} x_{1} & y_{1} & 1 & 0 & 0 & 0 & -x_{1}'x_{1} & -x_{1}'y_{1} & -x_{1}' \\ 0 & 0 & 0 & x_{1} & y_{1} & 1 & -y_{1}'x_{1} & -y_{1}'y_{1} & -y_{1}' \\ \vdots & & & \vdots & & \\ x_{n} & y_{n} & 1 & 0 & 0 & 0 & -x_{n}'x_{n} & -x_{n}'y_{n} & -x_{n}' \\ 0 & 0 & 0 & x_{n} & y_{n} & 1 & -y_{n}'x_{n} & -y_{n}'y_{n} & -y_{n}' \end{bmatrix} \begin{bmatrix} n & h \\ h_{01} \\ h_{02} \\ h_{10} \\ h_{11} \\ h_{12} \\ h_{20} \\ h_{21} \\ h_{22} \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 2n \end{bmatrix}$$

грол

- Can be written as a least squares problem $\min_{h} ||Ah||_2^2$
- Can we use the Moore-Penrose pseudo inverse here?

• Taking all matches into account:

$$\begin{bmatrix} x_{1} & y_{1} & 1 & 0 & 0 & 0 & -x_{1}'x_{1} & -x_{1}'y_{1} & -x_{1}' \\ 0 & 0 & 0 & x_{1} & y_{1} & 1 & -y_{1}'x_{1} & -y_{1}'y_{1} & -y_{1}' \\ & & & \vdots & & \\ x_{n} & y_{n} & 1 & 0 & 0 & 0 & -x_{n}'x_{n} & -x_{n}'y_{n} & -x_{n}' \\ 0 & 0 & 0 & x_{n} & y_{n} & 1 & -y_{n}'x_{n} & -y_{n}'y_{n} & -y_{n}' \end{bmatrix} \begin{bmatrix} h_{00} \\ h_{01} \\ h_{02} \\ h_{10} \\ h_{11} \\ h_{12} \\ h_{20} \\ h_{21} \\ h_{22} \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 0 \\ h_{21} \\ h_{22} \\ h_{22} \\ h_{21} \\ h_{22} \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 1 \\ 1 \\ h_{22} \\ h_{21} \\ h_{22} \end{bmatrix} = \begin{bmatrix} 0 \\ 1 \\ 0 \\ 2n \end{bmatrix}$$

- Can be written as a least squares problem $\min_{h} ||Ah||_2^2$
- But this is underdetermined, (8 degrees of freedom) how do we account for the unknown scale factor?

• we solve the *homogeneous* least squares problem

$$\min_{h} E = ||Ah||_{2}^{2}$$

s.t. $||h||_{2} = 1$

• Solve with eigenvalue decomposition of $A^T A$ or SVD

A 2nx9 **0** 2n

h

Reminder: Least Squares

Convert the system to a linear least-squares problem:

$$E_{\text{LLS}} = \|\mathbf{A}\boldsymbol{x} - \boldsymbol{b}\|^2$$

Expand the error:

$$E_{\text{LLS}} = \boldsymbol{x}^{\top} (\mathbf{A}^{\top} \mathbf{A}) \boldsymbol{x} - 2 \boldsymbol{x}^{\top} (\mathbf{A}^{\top} \boldsymbol{b}) + \| \boldsymbol{b} \|^2$$

Minimize the error:

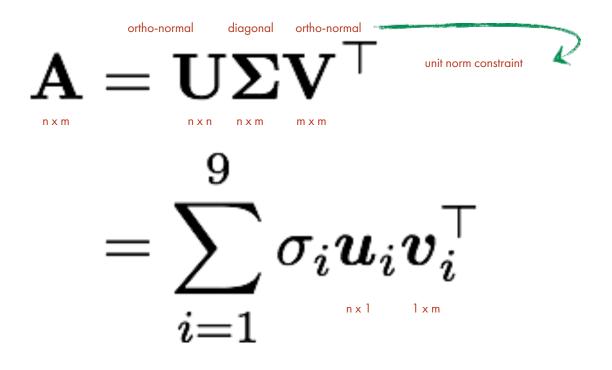

Set derivative to 0 $(\mathbf{A}^{ op}\mathbf{A})m{x} = \mathbf{A}^{ op}m{b}$

In Matlab:

$$x = A \setminus b$$

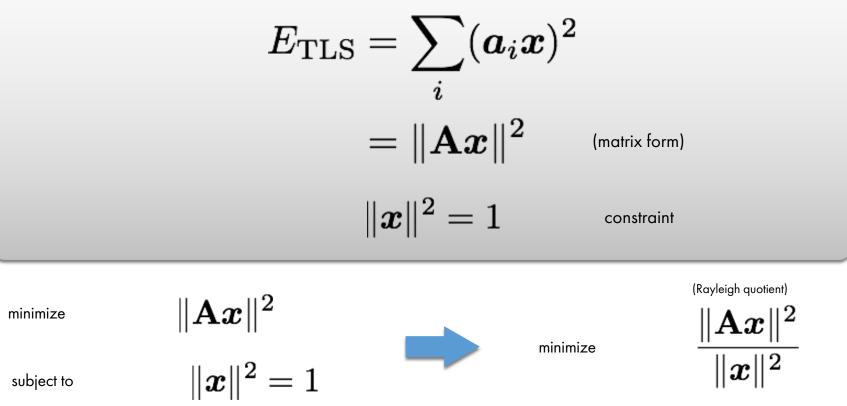

Note: You almost <u>never</u> want to compute the inverse of a matrix.

Singular Value Decomposition

General form of total least squares

Solution is the eigenvector corresponding to smallest eigenvalue of $A^{\top}A$ Solution is the column of V corresponding to smallest singular value $A = IJ\Sigma V^{\top}$

Solving for H using DLT

(Direct linear transformation: algorithm for solving homographies)

Given
$$\{x_i, x_i'\}$$
 solve for H such that $x' = Hx$
1. For each correspondence, create 2x9 matrix A_i
2. Concatenate into single 2n x 9 matrix A
3. Compute SVD of $A = U\Sigma V^{\top}$
4. Store singular vector of the smallest singular value $h =$

 $v_{\hat{i}}$

Image Alignment Algorithm: Homography

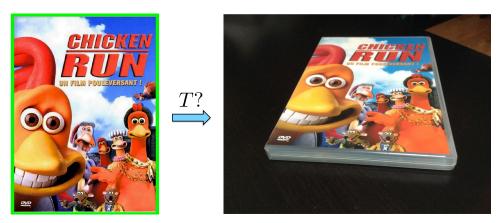

- Given images I and J
 - How can we find the alignment between images?

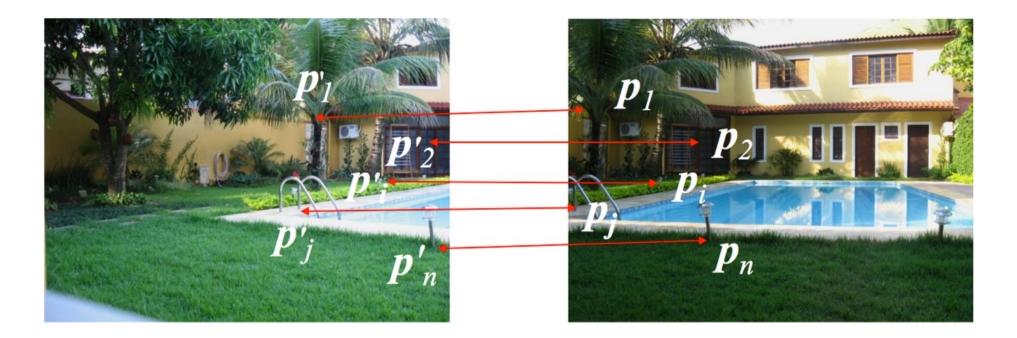

- 1. Compute image features for / and J
- 2. Match features between / and J
- 3. Compute homography transformation A between I and J

Image Alignment Algorithm: Homography

- Given images I and J
 - How can we find the alignment between images?

• Compute the matches

[Source: R. Queiroz Feitosa]

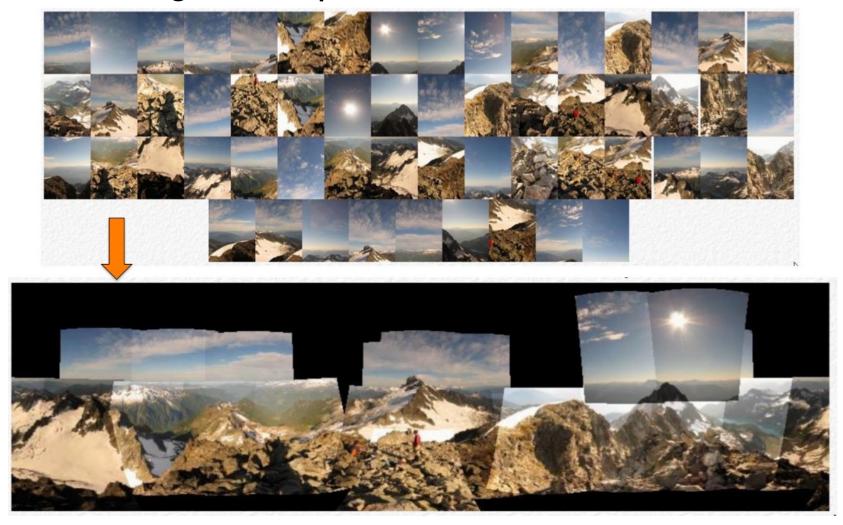

• Estimate the homography and warp

[Source: R. Queiroz Feitosa]

• Stitch

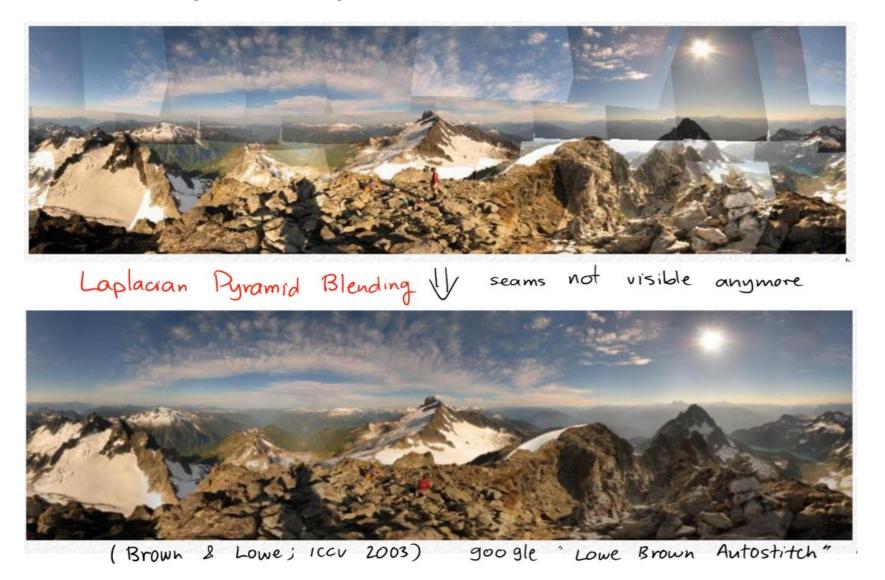

[Source: R. Queiroz Feitosa]

[Source: Fernando Flores-Mangas]

[Source: Fernando Flores-Mangas]

The image correspondence pipeline

- 1. Feature point detection
 - Detect blobs using, e.g., multi-scale LoG

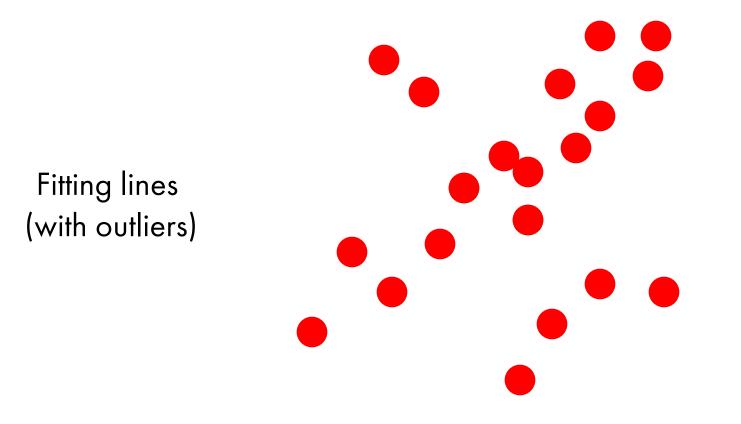

- 2. Feature point description
 - Describe features using the SIFT descriptor.

3. Feature matching

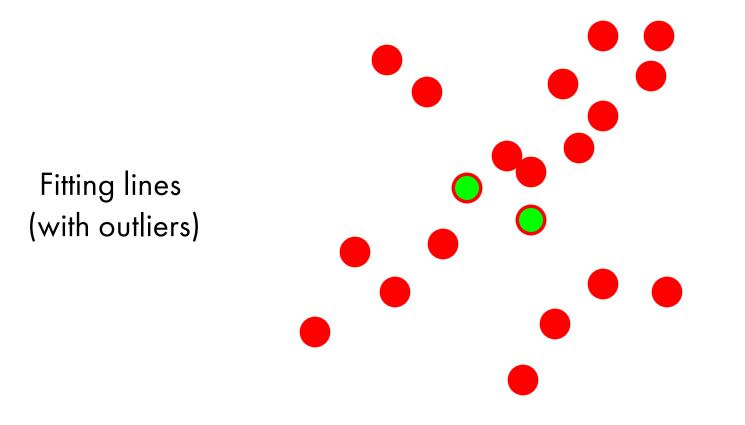

How do we estimate homographies when we have both good and bad correspondences?

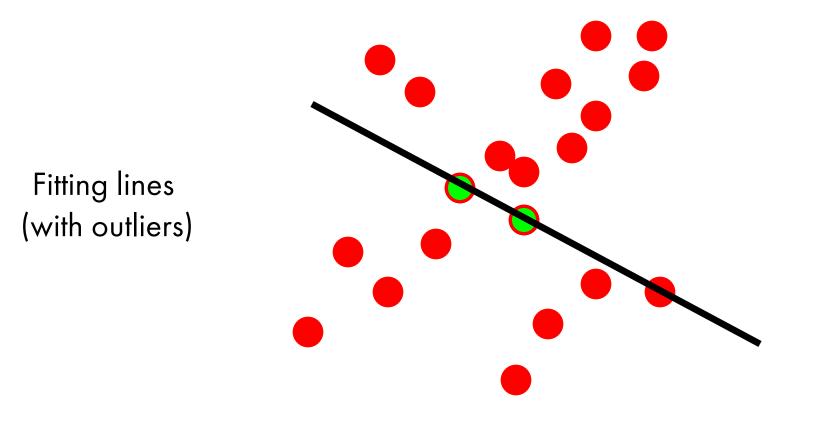

Random Sample Consensus (RANSAC)

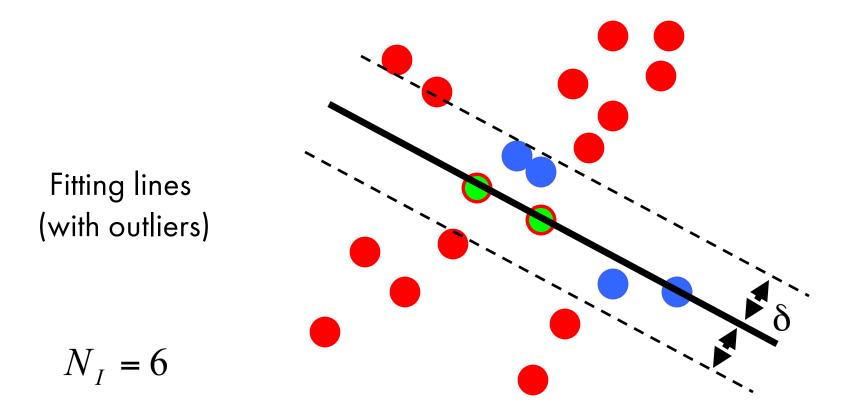

- 1. Sample (randomly) the number of points required to fit the model
- 2. Solve for model parameters using samples
- 3. Score by the fraction of inliers within a preset threshold of the model

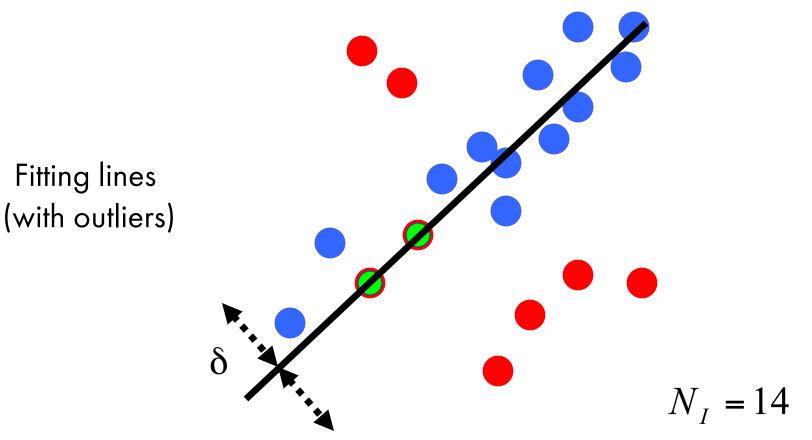

- 1. Sample (randomly) the number of points required to fit the model
- 2. Solve for model parameters using samples
- 3. Score by the fraction of inliers within a preset threshold of the model

- 1. Sample (randomly) the number of points required to fit the model
- 2. Solve for model parameters using samples
- 3. Score by the fraction of inliers within a preset threshold of the model

- 1. Sample (randomly) the number of points required to fit the model
- 2. Solve for model parameters using samples
- 3. Score by the fraction of inliers within a preset threshold of the model

- 1. Sample (randomly) the number of points required to fit the model
- 2. Solve for model parameters using samples
- 3. Score by the fraction of inliers within a preset threshold of the model

- Number of samples N
 - Choose N so that, with probability p, at least one random sample is free from outliers (e.g. p=0.99) (outlier ratio: e)

- Number of samples N
 - Choose N so that, with probability p, at least one random sample is free from outliers (e.g. p=0.99) (outlier ratio: e)
- Number of sampled points s

-Minimum number needed to fit the model

- Number of samples N
 - Choose N so that, with probability p, at least one random sample is free from outliers (e.g. p=0.99) (outlier ratio: e)
- Number of sampled points s

-Minimum number needed to fit the model

- Distance threshold δ
 - Choose $\delta\,$ so that a good point with noise is likely (e.g., prob=0.95) within threshold

- Number of samples N
 - Choose N so that, with probability p, at least one random sample is free from outliers (e.g. p=0.99) (outlier ratio: e)
- Number of sampled points s

-Minimum number needed to fit the model

- Distance threshold δ
 - Choose $\delta\,$ so that a good point with noise is likely (e.g., prob=0.95) within threshold
 - Zero-mean Gaussian noise with std. dev. $\sigma\!\!:t^2\!\!=\!\!3.84\sigma^2$

$$N = \frac{\log(1-p)}{\log\left(1-(1-e)^s\right)}$$

p = desired probability that we get a good sample
s = number of points in a sample

- N = number of samples (we want to compute this)
- e = probability that a point is an outlier

- Number of samples N
 - Choose N so that, with probability p, at least one random sample is free from outliers (e.g. p=0.99) (outlier ratio: e)
- Number of sampled points s

-Minimum number needed to fit the model

- Distance threshold $\boldsymbol{\delta}$
 - Choose $\delta\,$ so that a good point with noise is likely (e.g., prob=0.95) within threshold

$$N = \frac{\log(1-p)}{\log\left(1-(1-e)^s\right)}$$

p = desired probability that we get a good sample
s = number of points in a sample

- N = number of samples (we want to compute this)
- e = probability that a point is an outlier

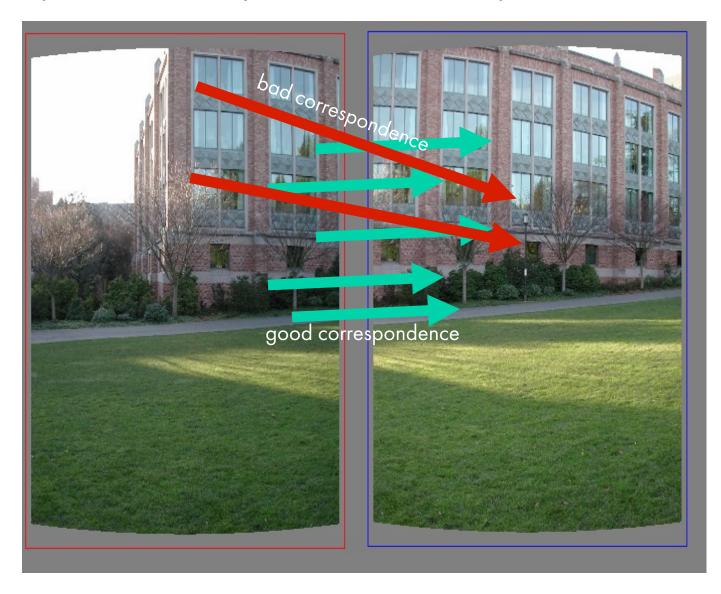

can you derive this? Hint: start with writing the probability that you choose one inlier point, then that you choose 's' inlier points...

Given two images...

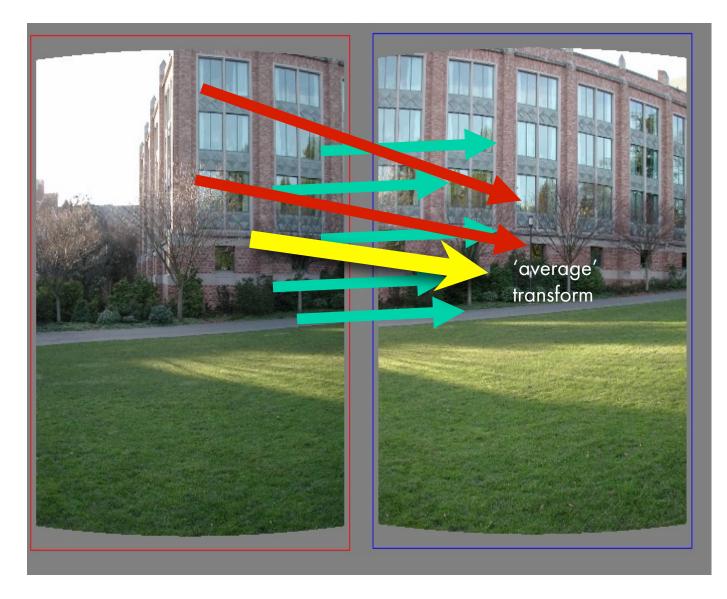

find matching features (e.g., SIFT) and a translation transform

Matched points will usually contain bad correspondences

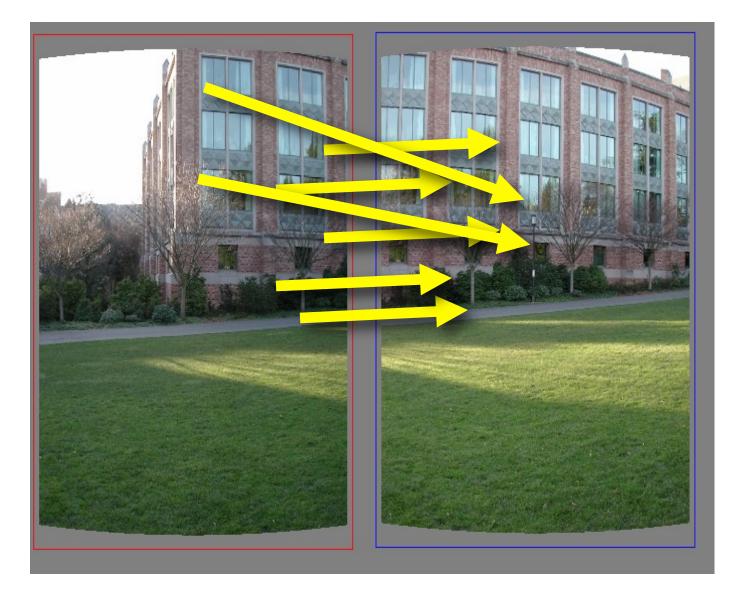

how should we estimate the transform?

LLS will find the 'average' transform

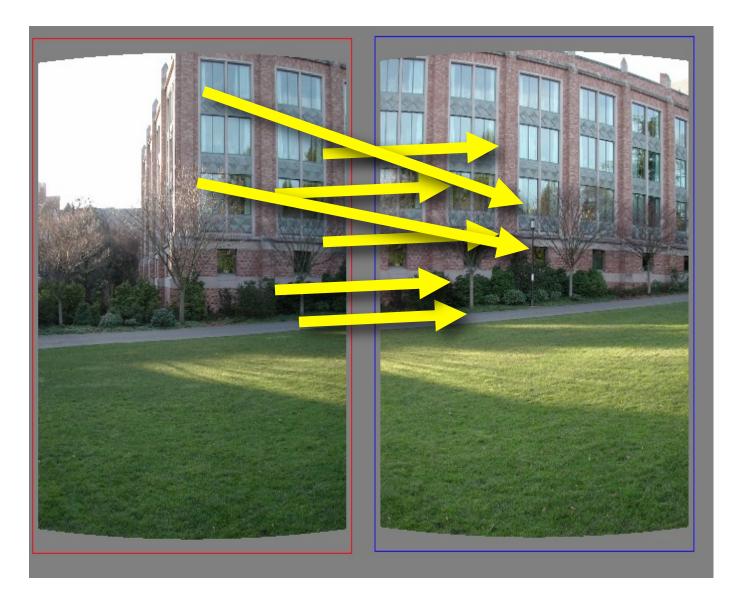

solution is corrupted by bad correspondences

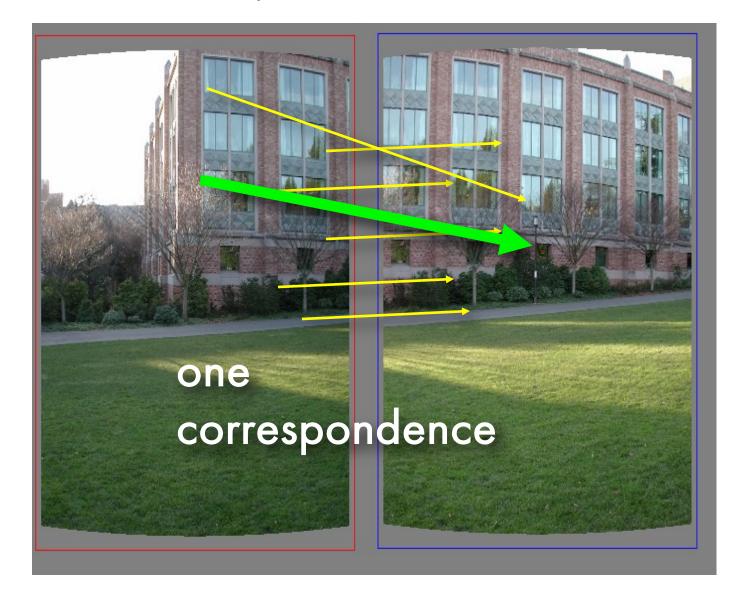

Use RANSAC

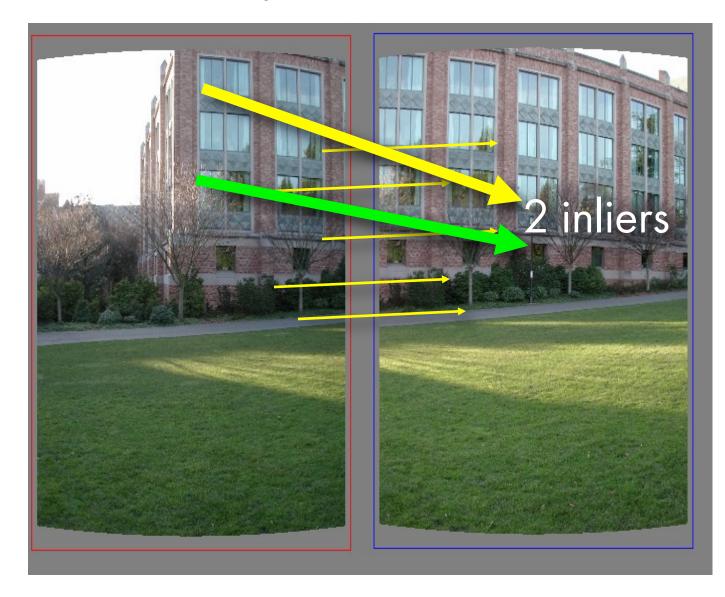

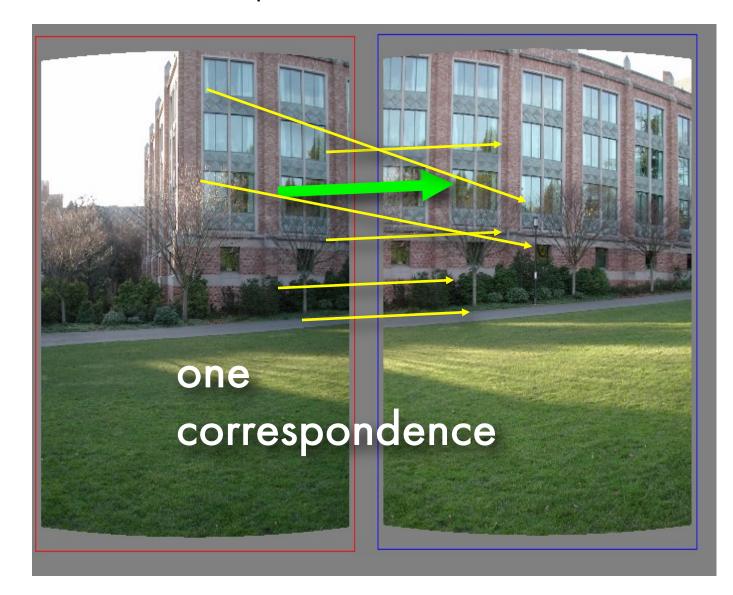

How many correspondences to compute translation transform?

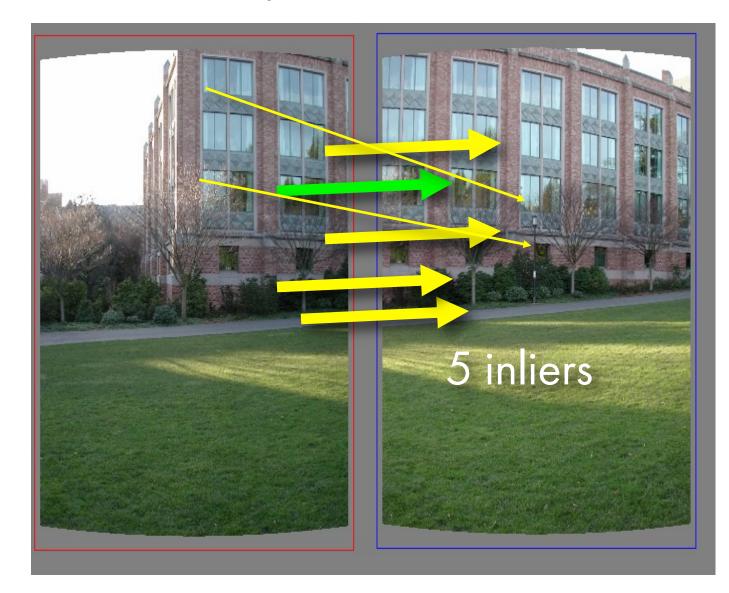

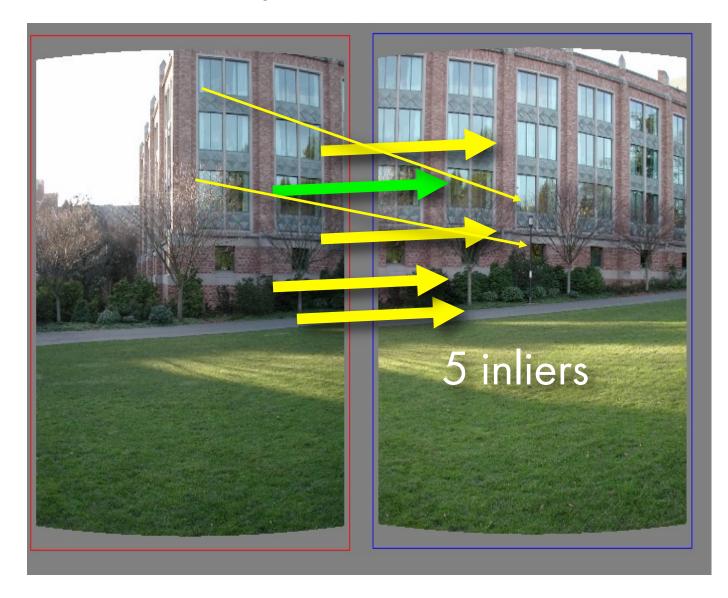

Need only one correspondence, to find translation model

Pick the model with the highest number of inliers!

Estimating homography using RANSAC

• RANSAC loop

1. Get point correspondences (randomly)

- RANSAC loop
 - 1. Get four point correspondences (randomly)
 - 2. Compute H using

- RANSAC loop
 - 1. Get four point correspondences (randomly)
 - 2. Compute H using DLT

3. Count

- RANSAC loop
 - 1. Get four point correspondences (randomly)
 - 2. Compute H using DLT
 - 3. Count inliers
 - 4. Keep H if

- RANSAC loop
 - 1. Get four point correspondences (randomly)
 - 2. Compute H using DLT
 - 3. Count inliers
 - 4. Keep H if largest number of inliers
- Recompute H using all inliers

The image correspondence pipeline

- 1. Feature point detection
 - Detect corners using the Harris corner detector.

- 2. Feature point description
 - Describe features using the Multi-scale oriented patch descriptor.

- 3. Feature matching and homography estimation
 - Do both simultaneously using RANSAC.

Summary – Stuff You Need To Know

- •A homography is a mapping between projective planes
- •You need at least 4 correspondences (matches) to compute it
- How do we assemble and solve the constrained least squares system?
- •What is the RANSAC algorithm and how can I apply it to a model fitting problem?

- OpenCV (Python):
 - Affine transformation/warp:
 - getAffineTransform(pts_src, pts_dst)
 - warpAffine
 - Perspective transformation/warp:
 - either: getPerspectiveTransform (pts_src, pts_dst) (without RANSAC)
 - or: h, status = cv2.findHomography(pts_src, pts_dst) (with RANSAC)
 - im_dst = warpPerspective(im_src, h, size)

Birdseye View on What We Learned So Far

Problem	Detection	Description	Matching
Find Planar	Scale Invariant	Local feature:	All features to all features
Distinctive Objects	Interest Points	SIFT	+ Affine / Homography

More than one image

•We're in 2023...

•Think not (only) what you can do with one image, but what lots and lots of images can do for you

More than one image

•We're in 2023...

•Think not (only) what you can do with one image, but what lots and lots of images can do for you

• Would our current matching method work with lots of data?

Looking forward (object detection)

- So far we matched a known object in a new viewpoint
- •What if we have to match an object to LOTS of images? Or LOTS of objects to one image?
- •We'll discuss this in a few weeks (object recognition)
