

# Lecture 15: Verification and Validation

Refresher: definitions of V&V

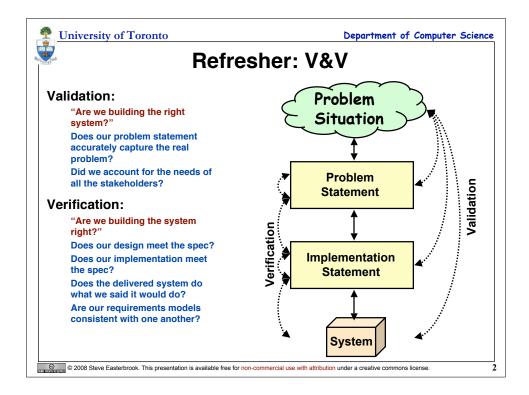

#### **V&V** strategies

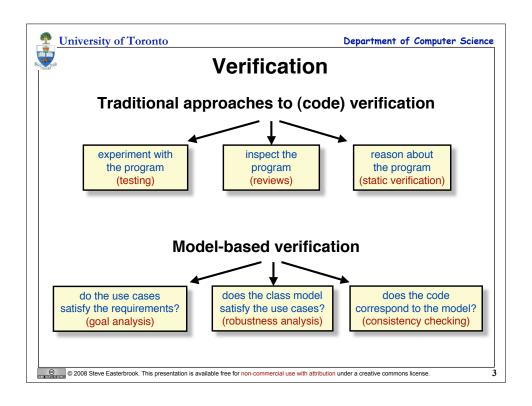

Modeling and Prototyping Inspection Formal Analysis (Testing)

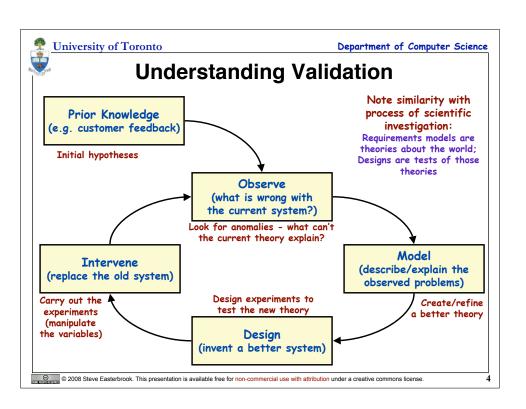

#### Independent V&V

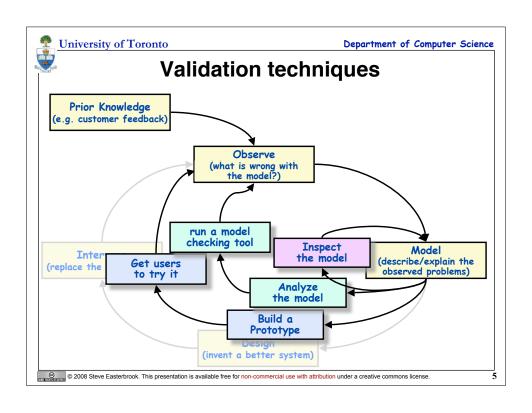

#### **Quality Assurance**

### **Prototyping**

#### **Presentation Prototypes**

Explain, demonstrate and inform - then throw away e.g. used for proof of concept; explaining design features; etc.

#### **Exploratory Prototypes**

Used to determine problems, elicit needs, clarify goals, compare design options Informal, unstructured and thrown away.

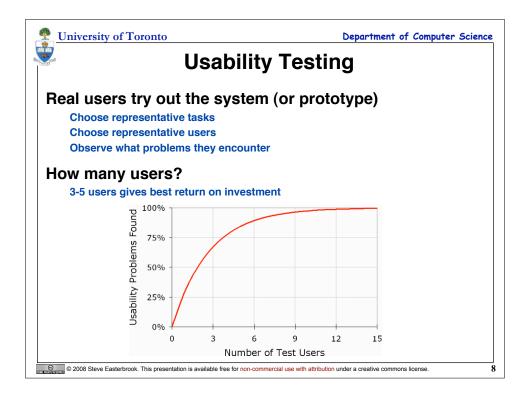

#### **Breadboards or Experimental Prototypes**

Explore technical feasibility, or test suitability of a technology, then thrown away Typically no user/customer involvement

#### **Evolutionary**

(a.k.a. "operational prototypes", "pilot systems"): Development seen as continuous process of adapting the system "prototype" is an early deliverable, to be continually improved.

### **Model Analysis**

#### Verification

"Is the model well-formed?"

Are the parts of the model consistent with one another?

#### Validation:

Animation of the model on small examples

Formal challenges:

"if the model is correct then the following property should hold..."

'What if' questions:

reasoning about the consequences of particular requirements;

reasoning about the effect of possible changes

"will the system ever do the following..."

State exploration

E.g. use model checking to find traces that satisfy some property

### **UML Consistency Checking**

#### Use Case Diagrams

Does each use case have a user?

Does each user have at least one use case?

Is each use case documented?

Using sequence diagrams or equivalent

#### **Class Diagrams**

Does the class diagram capture all the classes mentioned in other diagrams? Does every class have methods to get/set its attributes?

#### Sequence Diagrams

Is each class in the class diagram?

Can each message be sent?

Is there an association connecting sender and receiver classes on the class diagram?

Is there a method call in the sending class for each sent message?

Is there a method call in the receiving class for each received message?

### **Model Checkers**

#### **Automatically check properties** (expressed in Temporal Logic)

temporal logic adds modal operators to FOPL:

e.g.  $\Box p$  - p is true now and always (in the future)

e.g.  $\Diamond p$  - p is true eventually (in the future)

e.g. □(p⇒♦q) - each p is eventually followed by a q

#### The model may be:

of the program itself (each statement is a 'state')

an abstraction of the program

a model of the specifications

a model of the requirements

#### A Model Checker searches all paths in the state space

...with lots of techniques for reducing the size of the search

Model checking does not guarantee correctness...

it only tells you about the properties you ask about

it may not be able to search the entire state space (too big!)

Department of Computer Science

### Inspections...

#### "Management reviews"

E.g. preliminary design review (PDR), critical design review (CDR), ... Used to provide confidence that the design is sound Audience: management and sponsors (customers)

#### "Walkthroughs" = scientific peer review

developer technique (usually informal) used by development teams to improve quality of product focus is on understanding design choices and finding defects

#### "(Fagan) Inspections"

a process management tool (always formal) used to improve quality of the development process collect defect data to analyze the quality of the process written output is important major role in training junior staff and transferring expertise

### Why use inspection?

#### Inspections are very effective

Code inspections are better than testing for finding defects For *Models* and *Specs*, ensures domain experts carefully review them

#### **Key ideas:**

Preparation: reviewers inspect individually first

Collection meeting: reviewers meet to merge their defect lists

Log each defect, but don't spend time trying to fix it

The meeting plays an important role:

Reviewers learn from one another when they compare their lists

Additional defects are uncovered

Defect profiles from inspection are important for process improvement

#### Wide choice of inspection techniques:

What roles to use in the meeting? How to structure the meeting?

What kind of checklist to use?

### Structuring the inspection

#### Checklist

uses a checklist of questions/issues review structured by issue on the list

#### Walkthough

one person presents the product step-by-step review is structured by the product

#### **Round Robin**

each reviewer in turn gets to raise an issue review is structured by the review team

#### **Speed Review**

each reviewer gets 3 minutes to review a chunk, then passes to the next person good for assessing comprehensibility!

## Benefits of formal inspection Source: Adapted from Blum, 1992, Freedman and Weinberg, 1990, & notes from Philip Johnson.

#### For applications programming:

more effective than testing

most reviewed programs run correctly first time compare: 10-50 attempts for test/debug approach

#### Data from large projects

error reduction by a factor of 5; (10 in some reported cases)

improvement in productivity: 14% to 25%

percentage of errors found by inspection: 58% to 82%

cost reduction of 50%-80% for V&V (even including cost of inspection)

#### Effects on staff competence:

increased morale, reduced turnover

better estimation and scheduling (more knowledge about defect profiles)

better management recognition of staff ability

### **Role for Independent V&V?**

#### V&V performed by a separate contractor

Independent V&V fulfills the need for an independent technical opinion.

Cost between 5% and 15% of development costs

NASA Studies show up to fivefold return on investment:

Errors found earlier, cheaper to fix, cheaper to re-test

Clearer specifications

Developer more likely to use best practices

#### Three types of independence:

#### Managerial Independence:

separate responsibility from that of developing the software can decide when and where to focus the V&V effort

#### **Financial Independence:**

Costed and funded separately

No risk of diverting resources when the going gets tough

#### **Technical Independence:**

Different personnel, to avoid analyst bias

Use of different tools and techniques

### **Quality Assurance**

#### V&V focuses on the quality of the product(s)

requirements, models, specifications, designs, code,...

#### QA focuses on the quality of the processes

How well are the processes documented?

How well do people follow these processes?

Does the organisation measure key quality indicators?

Does the organisation learn from its mistakes?

#### **Examples:**

ISO9001

**TickIt** 

**Capability Maturity Model (CMM)** 

**Total Quality Management (TQM)**

### University of Toronto

Department of Computer Science

### E.g. CMM

Level	Characteristic	Key Challenges
5. Optimizing	Improvement fed back into process	Identify process indicators "Empower" individuals
4. Managed	(Quantitative) measured process	Automatic collection of process data Use process data to analyze and modify the process
3. Defined	(Qualitative) process defined and institutionalized	Process measurement Process analysis Quantitative Quality Plans
2. Repeatable	(Intuitive) process dependent on individuals	Establish a process group Identify a process architecture Introduce SE methods and tools
1. Initial	Ad hoc / Chaotic No cost estimation, planning, management.	Project Management Project Planning Configuration Mgmnt, Change Control Software Quality Assurance

© 2008 Steve Easterbrook. This presentation is available free for non-commercial use with attribution under a creative commons license.

### **Arguments against QA**

#### Costs may outweigh the benefits

Costs: Increased documentation; more meetings; ... Benefits: Improved quality of the process outputs (better software?)

### Reduced "agility"

Documenting the processes makes them less flexible

### Reduced "thinking"

Following the defined process gets in the way of thinking about the best way to do the job

#### **Barrier to Innovation**

New ideas have to be incorporated into the Quality Plan and get signed off

#### **Demotivation**

Extra bureaucracy makes people frustrated
